National Park Service  
Natural Resource Stewardship and Science  
Fort Collins, Colorado

The National Park Service, Natural Resource Stewardship and Science office in Fort Collins, Colorado, publishes a range of reports that address natural resource topics. These reports are of interest and applicability to a broad audience in the National Park Service and others in natural resource management, including scientists, conservation and environmental constituencies, and the public.

The Natural Resource Data Series is intended for timely release of basic data sets and data summaries. Care has been taken to assure accuracy of raw data values, but a thorough analysis and interpretation of the data has not been completed. Consequently, the initial analyses of data in this report are provisional and subject to change.

All manuscripts in the series receive the appropriate level of peer review to ensure that the information is scientifically credible, technically accurate, appropriately written for the intended audience, and designed and published in a professional manner. This report received informal peer review by subject-matter experts who were not directly involved in the collection, analysis, or reporting of the data. Data in this report were collected and analyzed using methods based on established, peer-reviewed protocols and were analyzed and interpreted within the guidelines of the protocols.

Views, statements, findings, conclusions, recommendations, and data in this report do not necessarily reflect views and policies of the National Park Service, U.S. Department of the Interior. Mention of trade names or commercial products does not constitute endorsement or recommendation for use by the U.S. Government.

This report is available in digital format from Mediterranean Coast Inventory and Monitoring Network site (<http://science.nature.nps.gov/im/units/medn/index.cfm>) and the Natural Resource Publications Management website (<http://www.nature.nps.gov/publications/nrpm/>). To receive this report in a format optimized for screen readers, please email [irma@nps.gov](mailto:irma@nps.gov).

## **Executive Summary**

The Channel Islands National Park (CINP) has conducted long-term ecological monitoring of the kelp forests around Santa Barbara, Anacapa, Santa Cruz, Santa Rosa and San Miguel Islands since 1982. The Kelp Forest Monitoring Program (KFMP) established 16 permanent transects between 1981 and 1986 with the first sampling beginning in 1982. An additional site, Miracle Mile, was established at San Miguel Island in 2001 by a commercial fisherman with assistance from the park and has been intermittently monitored since. In 2003, four sites were established and sampled at San Clemente Island, Naval Auxiliary Landing Field, under a contract with the U.S. Navy. These sites were monitored in 2003 and 2004, but have not been monitored since due to insufficient funding. In 2005, an additional 16 additional permanent sites were established to collect base line data from inside and adjacent to the newly established Marine Protected Areas (MPAs) for later evaluation. These new sites were initially established with three years (2005-2007) of funding from the NPS National Resource Preservation Program (NRPP).

Observations and results of the 2007 CINP's KFMP are described in this report. Population dynamics of 70 taxa or categories, of algae, fish and invertebrates were measured at all 33 permanent sites in 2006. These 33 sites consisted of the original 16 kelp forest monitoring sites at the five park islands, one additional site on San Miguel Island added in 2001, and the 16 new sites that were established in 2005 at Santa Barbara, Anacapa, Santa Cruz and Santa Rosa Islands. Survey techniques follow the Channel Islands National Park's Kelp Forest Monitoring Protocol Handbook Vol. 1 (Davis et al. 1997). The techniques utilize SCUBA and surface-supplied air to perform 1 m quadrats, 5 m quadrats, band transects, random point contacts, fish transects, roving diver fish counts, video transects, size frequency measurements and artificial recruitment modules. Temperature data were collected using remote temperature loggers at 32 sites, the exception being Miracle Mile where there is no logger installed. In addition to the Kelp Forest Monitoring (KFM) protocol, the Partnership for Interdisciplinary Studies of Coastal Oceans (PISCO) fish abundance and size monitoring protocol was conducted at 24 of the monitoring sites involved in the fine scale Marine Protected Area (MPA) evaluation designed by the park. PISCO conducted this monitoring for the park under a Cooperative Agreement with the University of California at Santa Barbara (UCSB) and the funding was from NRPP funded project mentioned above.

To conduct the 2007 monitoring efforts, 61 days of vessel time were utilized and 1026 dives totaling 979 hours, or 41 days of bottom time, were logged by park divers, interns and volunteers. This dive effort includes the dives KFM divers conducted to do the California Department of Fish and Game (CDFG) benthic Cooperative Research and Assessment of Near shore Ecosystems (CRANE) surveys at 12 sites. All of the proposed monitoring was completed in 2007. This annual report contains a summary of the methods used to conduct the monitoring in 2007 and a brief description of the sites along with the results. All of the data collected during 2007 can be found summarized in the Appendices A-L in this report.

In 2007, 13 sites were mature *Macrocystis pyrifera* (giant kelp) forests, two sites were developing kelp forests, one site was in a state of transition, 16 sites were dominated by echinoderms and one site was half mature kelp forest and half dominated by *Strongylocentrotus* spp. Of the 16 sites dominated by echinoderms, three were dominated by *Strongylocentrotus purpuratus*, one by *Ophiothrix spiculata*, one by *O. spiculata* and *S. franciscanus*, one by *O. spiculata* and *S. purpuratus*, two by *S. purpuratus* and *S. franciscanus* and *O. spiculata* and eight were dominated by *S. purpuratus* and *S. franciscanus*. This information is summarized in [Table 4](#) and compares it to the 2006 site status.

At Santa Barbara Island, there was an absence of kelp forests at our six monitoring sites and this is representative of the rest of the island. There seemed to be no continued recovery of the kelp forests that was observed early last year. All six of the sites were mostly dominated by echinoderms. Five of the sites were dominated by *S. purpuratus* and *S. franciscanus*. Southeast Sea Lion and Graveyard Canyon also had an abundance of *Ophiothrix spiculata*. One site, Southeast Reef had a mature kelp forest present along 40 meters of the transect, but the remainder was dominated by *Strongylocentrotus* spp., similar to the other sites. This island remains relatively barren with little algae and similar high echinoderm density and distribution as observed in recent years. There is little indication that kelp forests will return to much of this island in the near future.

At Anacapa Island, the seven KFM sites changed little from last year. Mature kelp forests were present at two sites within the original Anacapa Island Ecological Reserve, one site was in a state of transition presumably towards a kelp forest and the remaining four sites were dominated by echinoderms. Of these four sites, one was dominated by *Ophiothrix spiculata*, two by *O. spiculata*, *S. franciscanus* and *S. purpuratus*, and one site by *Strongylocentrotus purpuratus* and *S. franciscanus*. In general, we feel that these seven kelp forest monitoring sites well reflect the state of rocky reefs surrounding Anacapa Island.

At Santa Cruz Island, the states of the ten sites were all similar to last year. Three had mature kelp forests, while one was in a state of transition to what we presume to become a kelp forest. The remaining seven sites were dominated by echinoderms. Of these, three were dominated by *Strongylocentrotus purpuratus*, and four by *S. purpuratus* and *S. franciscanus*. Though Pelican Bay remained dominated by *S. purpuratus*, there was the development of a kelp forest at the far southern end of the transect. In addition, Fry's Harbor is now what we call in a state of transition and we believe may become a kelp forest soon. We believe the KFM monitoring sites well represent the rocky reef conditions on the eastern two thirds of the island, but do not represent the areas west of Gull Island as well.

At Santa Rosa Island, kelp forests continued to be dense and abundant and were present at all seven sites. Mature kelp forests were present at six sites and one, Cluster Point, was a developing kelp forest. Rodes Reef, which was in a state of transition last year, had developed into a mature kelp forest. *Strongylocentrotus* spp. densities remained similar to last year at all Santa Rosa Island sites with notably larger individuals than on the more eastern islands.

At San Miguel Island, kelp forests were also similar to recent years, with healthy and mature plants forming dense canopies at all three of the KFM monitoring sites.

## Acknowledgements

This ecological monitoring program was supported by the U.S. National Park Service in cooperation with CDFG and the U.S. Department of Commerce, National Oceanographic and Atmospheric Administration (NOAA), Marine Sanctuary Program. Supplemental funding was provided by the Montrose Settlements Restoration Program to continue monitoring the sites associated with the marine reserve evaluation. Funding was also provided by the California Coastal Conservancy to conduct CRANE benthic surveys at select sites.

We are deeply indebted to the many divers who have participated in this project in 2007 ([Table 5](#)). All of our volunteer divers are trained and/or certified with other agencies such as NOAA, CDFG, Aquariums, and Universities. Without this volunteer base of expert divers it would be impossible to conduct this program at its current funding level. We greatly appreciate the efforts of our captains Keith Duran, Diane Brooks, Brent Bixler, Terrance Shiff, Lou Moody, Mark Kibby and Ray Michalski for supporting us on the boats and our Diving Safety Officer, Dave Stoltz, for ensuring that all our operations run safely and successfully. We also like to thank the many well qualified PISCO divers from UCSB who conducted additional fish monitoring at the newly established sites.

## Information Requests

The kelp forest monitoring handbooks and annual reports are available in digital format from Mediterranean Coast Inventory and Monitoring Network site (<http://science.nature.nps.gov/im/units/medn/index.cfm>) and the Natural Resource Publications Management website (<http://www.nature.nps.gov/publications/nrpm/>).

To obtain raw data collected by this program, please write to the address below:

Ventura, CA 93001

## Introduction

The waters of the CINP and Channel Islands National Marine Sanctuary (CINMS) contain one-third of southern California's kelp forests (Davies, 1968). *Macrocystis pyrifera*, giant kelp, is the primary constituent of a southern California kelp forest, and over 1,000 species of macro flora and fauna live in this community (Woodhouse 1981, Engle pers. comm.). The kelp forest serves as food, shelter, substrate and a nursery to resident as well as migratory species. Many species, while not residents of the kelp forest, are dependent upon the existence and productivity of kelp forests; detrital flux from kelp forests provides an important source of nutrients to nearby rocky shore, sandy beach, and estuary communities. The kelp forests are essential to California's commercial and sport fisheries as well as the recreation and tourism industries.

CINP consists of five of the eight California Channel Islands (San Miguel, Santa Rosa, Santa Cruz, Anacapa, and Santa Barbara) and the submerged lands and waters within one nautical mile of each of the islands. The CINMS overlaps the subtidal portions of the park, and its boundary extends six miles seaward from the islands. CINP also bears the designation of International Biosphere Reserve and State of California Area of Special Biological Significance. The State of California maintains jurisdiction over the resources within the park and manages them through CDFG

San Clemente Island is the southernmost of the eight California Channel Islands. The waters surrounding the island out to 300 meters have been under exclusive management by the U.S. Navy since the 1920s. The State of California owns and manages the living marine resources extending three miles offshore. Management of these marine resources is the responsibility of CDFG.

The KFMP is part of a long-term ecological monitoring program designed to monitor the health of the park's marine ecosystem. By determining the limits of normal variation and identifying abnormal conditions, the KFMP assists management with prescribing remedial action to help preserve the park's marine resources.

Following a five year design study that began in 1982, the KFMP was implemented in 1987 by the park's resource management division, employing the protocols established during the design phase (Davis and Halvorson, 1988). Preliminary results and specific design considerations can be found in reports written by Davis (1985, 1986). Richards et al. (1997), describe monitoring efforts and results for 1982-1989. Richards et al. (1993a), Richards et al. (1993b), Richards and Kushner (1994), Kushner et al. al. (1995a), Kushner et al., (1995b), Kushner et al. (1997a), Kushner et al. (1997b), Kushner et al. (1998), Kushner et al. (2000), Kushner et al. (2001), Kushner et al. (2002a), Kushner et al. (2003b), Kushner et al. (2004c), Moss et al. (2005) and Kushner et al. (2006) – both in progress - describe the 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005 and 2006 monitoring efforts and results, respectively. A review of the KFMP was conducted in 1995 (Davis et al., 1996).

In 2005, the park was awarded three years of funding from the NPS's NRPP to Establish Baseline Ecological Conditions of Newly Established Marine Reserves at the Channel Islands. This project began this year with the addition and monitoring of 16 new sites. These sites were located inside or adjacent to the following four newly established marine protected areas (MPAs): Santa Barbara Island, Anacapa Island, Scorpion Anchorage MPA at Santa Cruz Island, and the South Point MPA at Santa Rosa Island. Only four of the 11 newly established MPAs were selected because of limited funding and the logistical constraints conducting this type of monitoring. These four MPAs were chosen for all or some of the following reasons: accessibility, to make the best use of the KFMP's existing base line data, and fishing impact. New sites were established to complement existing sites so that at least three sites were inside and three adjacent to each of the four MPAs.

This report summarizes the monitoring efforts and results from 2007, our 26<sup>th</sup> year of monitoring. The goal of these reports is to provide some insight into kelp forest dynamics and stimulate further research into the long-term trends and variations in this near-shore ecosystem. This report highlights some of the most significant observations and tries to provide a characterization for each site. Most organisms are referred to by genus and species; however, non-indicator species are described using both scientific and common names. Common names are cross-referenced to their scientific names in [Table 1](#). Since the original design of the kelp forest monitoring program, several genera and species names have been changed. The new names are cross-referenced in [Table 1](#).

## Methods

Abundances, and in some cases size structure, of 70 taxa or categories of algae, fish, and invertebrates ([Table 1](#)) were measured at 33 permanent sites ([Table 2](#)) around the five park islands ([Figure 1](#)). Site and species selection criteria, and sampling protocol are described in the Kelp Forest Monitoring Handbook Volume I (Davis et al., 1997). Sites were monitored between May 16<sup>th</sup> and October 12<sup>th</sup> 2007, using the CINP's vessel "Pacific Ranger", the CDF&G vessel "Garibaldi" and the NOAA vessel "Shearwater". Data management and entry procedures are described in the Kelp Forest Monitoring Handbook Volume II (Kushner et al. 1997).

Each site is marked by a 100 m long transect affixed to the rocky substrate. The sampling techniques employed to gather density and distribution data are summarized in [Table 3](#). At each monitoring site, 24 paired 1 m x 1 m quadrats, 40 continuous and adjacent 1 m x 5 m quadrats and 24 paired 3 m x 10 m band transects are systematically arranged along the transect with a randomly selected starting point. Additionally, 600 non-adjacent points termed random point contacts (RPCs) are conducted to determine percent cover of encrusting invertebrates, algae, and substrate composition; four 2 m x 3 m x 50 m fixed transects are used to determine fish abundance; fish size frequencies with a time component, count, and size estimate are used to determine an index of diversity, abundance and size; roving diver fish counts with a time component and count are used to determine an index of abundance and diversity; videotaped transects provide a record of the site appearance; size frequency measurements are collected to determine age structure and recruitment cohorts. All animals measured for the natural habitat size frequency distributions are located using a band transect search method. A general species list is established for each site, noting presence/absence and relative abundance for all recognizable species. Artificial recruitment modules (ARMs) were in place at eleven of the sites to measure recruitment and population structure of indicator species within the ARMs. A complete description of the monitoring protocols can be found in Davis et. al, 1997.

Remote temperature loggers, TIDBIT®, made by Onset Computer Corporation were deployed at each site. Loggers were encased in underwater housings and attached to stainless steel thread rods cemented to the bedrock at each site. At most sites, two temperature loggers were placed in the underwater housing. At these sites, a comparison of several temperatures from both loggers was made to see if the loggers were recording within their specifications (+- 0.2 °C). The results are included in the Results section of this report.

In past years, sampling at the kelp forest monitoring sites typically occurred over at least two separate dates, ranging from two weeks to several months apart during the sampling season. Separate sampling dates enabled us to conduct fish transects and roving diver fish counts two times at each site at least two weeks apart. Due to the addition of 16 new monitoring sites, effectively doubling the size of the KFMP, logistical constraints enabled us to only conduct fish transects and roving diver fish counts twice at 12 sites this year. However, in addition to the Kelp Forest Monitoring Program fish protocol, PISCO continued to perform their fish transect protocol that was performed at 24 sites from 2005 to 2007 as part of the three year Marine Reserve baseline study funded by NRPP under a

cooperative agreement with the park and UCSB. The methods for this protocol can be located at: <http://www.piscoweb.org/research/science-by-discipline/ecosystem-monitoring/kelp-forest-monitoring> and all data collected by PISCO are available by contacting them directly through their website.

In past years, and this year, we attempt to complete all abundance estimate techniques (1 m quadrats, 5 m quadrats, band transects, random point contacts, fish transects, fish size frequencies and roving diver fish count). During the second and subsequent visits, a second set of fish transects and roving diver fish counts are conducted, as well as any remaining size frequencies, ARMs, line repair or other unfinished work. Occasionally, abundance techniques are not completed during the first visit, and this is noted in the Results section below. If drastic changes in density and abundance are observed between visits, a second sampling event may be scheduled to collect further data on these observations. Such events are also noted in the below Results and Discussion sections. In the text, we report numbers to two significant digits.

# Channel Islands National Park

## Kelp Forest Monitoring Sites

Figure 1. Kelp Forest Monitoring Locations at the Channel Islands National Park.

## Results

Sampling was completed at all 33 monitoring sites and a summary of the 2007 status of each site is presented in [Table 4](#). Twenty-one divers ([Table 5](#)) collected data on seven five-day cruises, two four-day cruises, one three day cruise, seven two-day cruises and one day trip between May and October. A total of 1026 dives totaling 941 hours of bottom time were spent to conduct this year's monitoring. Not included in those totals are the dives or bottom time that PISCO divers incurred to conduct the fish monitoring. All prescribed monitoring data were collected in 2007 except the species list was completed at only six sites. Furthermore, due to logistical constraints, fish transects and roving diver fish counts were performed only once at 21 sites this year.

A brief description of each site is included with the station results below. Complete data summaries from the sampling protocol are listed in the appendices. Means for 1 m quadrats (Appendix A) represent average counts obtained from 24 paired 1 m x 1 m quadrats systematically arranged along the transect with a random starting point. Means for 5 m quadrats (Appendix B) represent average counts obtained from 40 continuous and adjacent 1 m x 5 m quadrats. Note that when adult, subadult and juvenile densities for *Macrocystis pyrifera* are listed in the station descriptions, the adult and subadult densities are derived from the 5 m quadrats and the juvenile densities from the 1 m quadrat data, unless otherwise noted. Means for band transects (Appendix C) represent average counts obtained from 24 paired 3 m x 10 m transects systematically arranged along the transect with a random starting point. Means for random point contacts (Appendix D) represent average percent cover for a given organism, group of taxa, or substrate at 15 quadrats systematically arranged along the transect with a random starting point. Forty points from each quadrat (600 points total) are used to determine percent cover of selected organisms and substrate within one meter of the bottom. Percent cover may total more than 100% due to layering (Davis et al., 1997).

Mean densities for fish transects (Appendix E) represent the average of four adjacent and continuous 2 m x 3 m x 50 m transects along the line. It should be noted that this is different from previous years when fish transects were 2 m x 3 m x 100 m. Cases listed refer to the total number of passes over the transect made during sampling.

The roving diver fish count data presented in Appendix F contains the number of observers that sampled and the total number of species observed for each sampling date and site. The following pages contain the average timed Score, the average Abundance score and an average Count for each sampling date and site. The score field is the average score of all observers. Score fields range between 5 and 10 for all observed fish species, but non-present indicator species will receive a score of zero. As a result, it is possible for indicator species to have an average score of less than 5, but not possible for write-in species. The Abundance field is the number assigned to the abundance categories: single (1 fish), few (2-10 fish), common (11-100 fish), or many (>100 fish). The Abundance field is summarized numerically where 1 = single, 2 = few, 3 = common and 4 = many. The Count field is the actual whole number of fish counted by an observer during the 30 minute roving diver fish count and is presented as the average count for all observers for each species listed.

Although divers will observe different numbers of the same species of fish at a site, we have chosen to use the highest value in the Count field to describe fish abundances and/or densities at each site location. All counts were conducted between 0900 and 1500 hours unless otherwise noted.

For each site, it will be noted if and when the PISCO fish sampling method was conducted. The notation will follow the fish summary section. **Table 7** lists all 24 sites where PISCO conducted fish transects. For all PISCO data requests, visit their website at [www.piscoweb.org/data](http://www.piscoweb.org/data).

Fish size frequency data and distributions are not included in this report. Raw data is available from the Channel Islands National Park by request.

Natural habitat size frequency distributions for invertebrates other than gorgonians and *Stylaster (Allopora) californica* are in Appendix H. *Macrocystis pyrifera* size frequency distributions are in Appendix I. Gorgonian and *Stylaster (Allopora) californica* size frequency distributions are in Appendix J. Size frequency measurements taken from the ARMs were kept separate from the natural habitat measurements and their distributions are in Appendix K. Species lists for sampled locations are in Appendix L. Video transects were completed for all locations and the video archives are stored at the park's headquarters in Ventura, California.

Temperature data was collected at all sites using TIDBIT<sup>TM</sup> temperature loggers with the one exception being Miracle Mile on San Miguel Island where no logger is installed. Temperature data is recorded by the loggers every hour throughout the year. There were two loggers deployed at each site and a comparison of the two temperature loggers was made to determine if the loggers were recording within factory specifications ( $\pm 0.2$  °C). To expedite report writing, we will present 12 months of temperature data from June 1<sup>st</sup> 2006 to May 31<sup>st</sup> 2007. See Appendix M for the temperature graphs for each site.

All of the Kelp Forest Monitoring temperature data through the 2006 sampling season is now available on the following webpage: <http://las.pfeg.noaa.gov/PaCOOS>.

**Location: Wyckoff Ledge, San Miguel Island**

**Site #1 SMWL**

**2007 sampling dates: 7/11.**

**2007 status: Mature kelp forest.**

This site was similar to last year and continued to be a mature, healthy kelp forest with an abundance of algae, moderate abundance of encrusting invertebrates on rocky outcrops and with some of the low lying areas appearing scoured. A thick canopy of *Macrocystis pyrifera* covered 100% of the transect. Though the *M. pyrifera* appeared relatively healthy, there were a moderate amount of epiphytic invertebrates on the blades. Adult *M. pyrifera* density was relatively high at  $0.55/m^2$ , while subadult and juvenile densities were relatively low at  $0.02/m^2$  and  $0.08/m^2$ , respectively and cover was 17%. *Macrocystis pyrifera* stipe density was high at  $10/m^2$ . No *Eisenia arborea* were observed on 1 m quadrats or RPCs, but were observed at the site. *Pterygophora californica* were common with adult density at  $0.42/m^2$ , juveniles at  $0.17/m^2$  and an overall cover of 7.2% and most appeared unhealthy. No *Laminaria farlowii* were observed, similar to past years. Miscellaneous brown algae cover was 7.5%. *Dictyoneuropopsis reticulata* was relatively abundant and counted on 1 m quadrats at  $3.6/m^2$ . Although *D. reticulata* is not one of our regular indicator species, it is moderately abundant to this site and we have recorded it 2004. *Desmarestia* spp. was common but its cover was lower than recent years at 0.17%. No *Cystoseira* spp. were observed at the site, which is very unusual. Green algae cover was 0.33%. Miscellaneous red algae cover was similar to last year at 25%. Articulated and encrusting coralline algae covers were 11% and 34% respectively, similar to recent years. Bare substrate increased from last year to 18%. Sand increased to 22% cover, although was similar to past years.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 15% and consisted mostly of hydroids. No *Phragmatopoma californica* was observed on RPCs for the third consecutive year. Tunicate cover was 1.3%. *Styela montereyensis* density was  $0.08/m^2$ , similar to past years. Sponge cover was 2.3%. *Tethya aurantia* was common at  $0.22/m^2$  and many clusters of small individuals were observed. Miscellaneous bryozoans were abundant at a cover of 22%. *Urticina lofotensis* density was  $0.4/m^2$ , the highest recorded since we first began monitoring this species at this site. *Balanophyllia elegans* and *Astrangia lajollaensis* covers were 1.5% and 0.5%, respectively. *Corynactis californica* cover was 0.33%. *Diopatra ornata* were abundant in the low-lying sandy areas at a cover of 14.0%.

*Pisaster giganteus* were recorded on both on 1 m quadrats and 5 m quadrats at densities of  $0.04/m^2$  and  $0.1/m^2$ , respectively. *Pisaster giganteus* were observed on the tops of the reef, but were rare directly along the transect similar to past years. *Patiria miniata* density was  $2.1/m^2$ . Small and large *Pycnopodia helianthoides* were common at  $0.02/m^2$ , similar to past years. *Parastichopus parvimensis* density was  $0.04/m^2$ , similar to past years. No sea star wasting disease was observed this year.

*Strongylocentrotus* spp. abundances were similar to recent years. *Strongylocentrotus franciscanus* were common in the cracks and crevices and *S. purpuratus* were rare. The density of *S. franciscanus* was  $0.21/m^2$  similar to recent years and all sizes observed. The *S. franciscanus* may be competing for

space *Haliotis rufescens* as they are often abundant in the same crevices. The density of *S. purpuratus* was 0.54/m<sup>2</sup>, similar to past years. No sea urchin wasting disease was observed.

*Haliotis rufescens* were relatively abundant at this site, similar to recent years, with a density of 0.10/m<sup>2</sup>. A total of 113 *H. rufescens* were located for size frequency measurements and a mean size of 171 mm was recorded. Similar to past years we conducted an extensive search along the entire transect and out ten meters and think this total is a good proxy for abundance at this site, in addition to the band transects. *Megathura crenulata* were rare at 0.003/m<sup>2</sup>. *Crassedoma giganteus* density was 0.01/m<sup>2</sup>. *Kelletia kelletii* were abundant at this site, similar to recent years, and were counted on both 1 m quadrats and band transects with densities of 0.67/m<sup>2</sup> and 0.55/m<sup>2</sup>, respectively. Several meters of area were covered in *K. kelletii* eggs mats, a common observation for this site. *Lithopoma gibberosa* were common at 0.42/m<sup>2</sup>. *Cancer productus* and *Cancer antennarius* were common at this site. *Cryptochiton stelleri*, gumboot chiton, continued to be relatively common at this site and we counted them on band transects with four observed (0.0055/m<sup>2</sup>) and five observed at the site.

Fish were moderately abundant and diverse at this site. *Coryphopterus nicholsii* density was 0.08/m<sup>2</sup> and up to 42 were observed on the roving diver fish count. *Oxylebius pictus* were common with up to 59 observed. Nine female, no juvenile and three male *Semicossyphus pulcher* were observed. A small school of up to 23 *Oxyjulis californica* was observed. Up to four adult and no juvenile *Embiotoca jacksoni* were observed. *Embiotoca lateralis* were moderately abundant with up to 31 adults and 11 juveniles observed. Up to five adult *Rhacochilus vacca* were observed. *Sebastes mystinus* were common with up to 26 adults and five juveniles recorded. Up to 40 adults and three juvenile *Sebastes atrovirens* were observed. Up to two adult and six juvenile *Sebastes serranoides* were observed. Up to two adult and one juvenile *Sebastes serriceps* were observed. Up to seven adult *Sebastes caurinus*, copper rockfish, were observed. *Sebastes chrysomelas*, black and yellow rockfish, were common with up to 19 observed. One adult and one juvenile *Sebastes carnatus*, gopher rockfish were observed. Two adult and one juvenile *Sebastes miniatus*, vermillion rockfish, were observed. Up to 62 kelp/gopher/black and yellow/copper rockfish young of the year complex (KGB) were observed. Two *Ophiodon elongatus*, lingcod, were observed. One *Scorpaenichthys marmoratus*, cabezon, was observed. *Brachystius frenatus*, kelp surfperch, were in the kelp canopy with up to 11 observed. A school of up to 350 *Aulorhynchus flavidus*, tubesnout, was observed. Roving diver fish counts were conducted on July 11<sup>th</sup> by seven divers observing 28 species.

The temperature loggers were retrieved and deployed and all data were successfully downloaded. Both loggers were recording within factory specifications of each other.

**Location: Hare Rock, San Miguel Island**

**Site #2 SMHR**

**2007 sampling dates: 7/10.**

**2007 status: Mature kelp forest.**

This site was similar to last year with a dense kelp forest of mature *Macrocystis pyrifera* and many patches of *Strongylocentrotus franciscanus* forming localized urchin barrens. The *M. pyrifera* were healthy looking and canopy cover was estimated at 100% over the transect. Adult, subadult and juvenile *M. pyrifera* were moderately abundant with densities of 0.22/m<sup>2</sup>, 0.5/m<sup>2</sup> and 1.9/m<sup>2</sup> respectively. *Macrocystis pyrifera* cover was 13%, similar to last year. *Macrocystis pyrifera* stipe density was 7.7/m<sup>2</sup>. Adult *Eisenia arborea* were common on top of the reef towards the east end of the transect, none were observed on RPCs, and adult and juvenile density were 0.08/m<sup>2</sup> and 0.0/m<sup>2</sup>, respectively. *Pterygophora californica* was not present, similar to past years. No *Laminaria farlowii* was present, but several *Laminaria setchellii* were observed. *Desmarestia* spp. were common near the western edge of the transect with a 6.7% cover, a decrease from last year, but similar to recent years. *Cystoseira* spp. cover was 0.5%. Miscellaneous brown algae cover was 2.5%, similar to last year. Green algae were common with a cover of 7.5%. Miscellaneous red algae remained relatively abundant with a cover of 18%. *Gelidium* spp. were not observed on RPCs this year. *Gigartina* spp. were present at 7.5%. This category consisted of *Gigartina corymbifera* which was abundant in patches. Articulated coralline algae were not observed on RPCs and this year, however, encrusting coralline algae was cover was 46.8%. Bare substrate cover was 14%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 5.2%, and consisted mostly of hydroids and *Dodecaceria fewkesi*, a colonial tube worm. Miscellaneous bryozoans cover was 5.8% with no *Diaperoecia californica* observed on RPCs. Sponge cover was 0.17% and *Tethya aurantia* density was 0.09/m<sup>2</sup>. Tunicates were also rare with 0.67% cover and no *Styela montereyensis* were observed. *Corynactis californica* cover was 4.2% and *Urticina lofotensis* was 0.022/m<sup>2</sup>, similar to last year. *Balanophyllia elegans* and *Astrangia lajollaensis* covers was 3.0/m<sup>2</sup> and 1.7/m<sup>2</sup>, respectively. *Diopatra ornata* cover was 2.8%. No gorgonians were observed, similar to past years as they are rare at this site.

*Strongylocentrotus franciscanus* density remained high with high density patches scattered throughout the site. Their density was 10.3/m<sup>2</sup>, similar to recent years. *Strongylocentrotus purpuratus* were rare with a density of 1.3/m<sup>2</sup> and were mostly under larger *S. franciscanus* or in the shallowest areas of the transect. Mean size of *S. franciscanus* was 55 mm, relatively small compared to other places on San Miguel Island, but similar to past years. With the high density patches of *S. franciscanus* at this site, it is difficult to imagine that this site will remain a kelp forest. No sea urchin wasting disease was observed.

*Pisaster giganteus* density decreased during both 1 m quadrats and 5 m quadrats to 0.25/m<sup>2</sup> and 0.03/m<sup>2</sup>, respectively. Similar to past years, most were small with a mean size of 61 mm. *Patiria miniata* remained abundant at 5.3/m<sup>2</sup>. *Pycnopodia helianthoides* were common with a density of

0.19/m<sup>2</sup>, similar to last year. No *Parastichopus parvimensis* were observed on 1 m quadrats third consecutive year, and were rare at the site. No sea star wasting disease was observed.

One small *Haliotis rufescens* was found under the spine canopy of a *Strongylocentrotus franciscanus* measuring about 13 mm. Two *H. rufescens* were observed during band transects for a density of 0.0028/m<sup>2</sup>. *Lithopoma gibberosa* were moderately abundant at 1.2/m<sup>2</sup>. *Kelletia kelletii* density was 0.02/m<sup>2</sup>. *Crassedoma giganteus* density remained low at 0.004/m<sup>2</sup>. *Megathura crenulata* were rare at 0.001/m<sup>2</sup> with only one observed during band transects. *Aplysia californica* density was 0.01/m<sup>2</sup>. *Cypraea spadicea* density was the highest recorded since 1983 at 1.1/m<sup>2</sup>.

Fish at this site were abundant and diverse with juvenile fish very common this year. *Coryphopterus nicholsii* density was 0.08/m<sup>2</sup> and up to 28 were observed during the roving diver fish count. There were several small (2-3 cm) *C. nicholsii* observed at the site. *Oxylebius pictus* density was 0.25/m<sup>2</sup> with up to 13 observed. A few very small *O. pictus* were observed. *Chromis punctipinnis* were relatively abundant for this site with up to 62 adults observed. *Oxylebius californica* were common with 17 observed. Up to three female, no juvenile and one male *Semicossyphus pulcher* were observed. Up to six adult but no juvenile *Embiotoca jacksoni* were observed. *Embiotoca lateralis* were abundant with up to 51 adults and 11 juveniles observed. There were several *Sebastes* spp. recorded at this site. *Sebastes mystinus* were moderately abundant with up to 32 adults and 10 juveniles observed. Adult *Sebastes atrovirens* were common with up to nine observed. Six adult *Sebastes serranoides* were observed. Seven adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. One adult *Sebastes auriculatus*, brown rockfish, was observed. Up to five *Sebastes caurinus*, copper rockfish, one *Sebastes rastrelliger*, grass rockfish, and one juvenile *Sebastes miniatus*, vermillion rockfish, were observed. Two *Ophiodon elongatus*, lingcod, were observed. Three *Scorpaenichthys marmoratus*, cabezon, were observed. Up to six adult *Rhacochilus vacca* and two adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. One *Hypsurus caryi*, rainbow surfperch, was observed. *Brachyistius frenatus*, kelp surfperch, were common with up to 25 observed. One *Rathbunella hypoplecta*, stripedfin ronquil, was observed. Several small groups of *Aulorhynchus flavidus*, tubesnout, were observed. Roving diver fish counts were conducted on July 10<sup>th</sup> by six divers observing 28 species.

The temperature loggers were retrieved and deployed and data were successfully downloaded. Both loggers were recording within factory specifications of each other.

**Location: Johnsons Lee North, Santa Rosa Island**

**Site #3 SRJLNO**

**2007 sampling dates: 9/26.**

**2007 status: Mature kelp forest.**

Overall, this site was similar to last year. The *Macrocystis pyrifera* canopy cover was thicker than usual with a cover estimated at 80%. There appeared to be some scouring at the site, similar to previous years.

Adult, subadult and juvenile densities of *M. pyrifera* were all similar to recent years at 0.67/m<sup>2</sup>, 0.34/m<sup>2</sup> and 3.7/m<sup>2</sup>, respectively, and cover was 27%. *Macrocystis pyrifera* stipe density was high at 7.5/m<sup>2</sup>. Adult *Eisenia arborea* were common on the upper edge of the shelf just inshore of the transect line, but were absent along the transect with no adults or juveniles observed on 1 m quadrats or RPCs, similar to past years. *Pterygophora californica* were common with adult and juvenile densities at 0.29/m<sup>2</sup> and 0.0/m<sup>2</sup>, respectively and a cover of 7.2%, all similar to recent years. Adult *Laminaria farlowii* were uncommon and adult and juvenile densities were 0.25/m<sup>2</sup> and 0.08/m<sup>2</sup>, respectively and a cover of 0.83%, similar to recent years. *Cystoseira* spp. cover was similar to last year at 3.3%, and most were small. *Desmarestia* spp. cover was 0.5%. Miscellaneous red algae cover was 34%, similar to past years. *Gigartina* spp. were moderately abundant with a cover of 5.8%. Articulated and encrusting coralline algae cover were 2.5% and 7.3% respectively, similar to past years. Bare substrate cover increased to 12%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* increased from last year to 29% and consisted mostly of hydroids, but included some *Spirorbis* spp., *Pista* spp. and amphipod tube mats. *Styela montereyensis* were abundant with a increase in density to 6.3/m<sup>2</sup>. Tunicates cover remained relatively high at 9.0%, similar to recent years. Sponge cover also remained relatively high at 4.2%. *Tethya aurantia* remained abundant at 0.13/m<sup>2</sup>. *Phragmatopoma californica* were abundant in the *Macrocystis pyrifera* holdfasts, but rare elsewhere with a cover of 9.2%. Miscellaneous bryozoans cover was 22%, similar to past years. The most abundant bryozoan species were *Membranipora* spp. and *Thalamoporella* spp. *Diaperoecia californica* cover was 1.7%. *Corynactis californica* cover was 1.8%. *Balanophyllia elegans* and *Astrangia lajollaensis* covers were 0.5% and 1.0%, respectively, similar to previous years.

*Strongylocentrotus* spp. remained at low densities along the transect. *Strongylocentrotus franciscanus* and *S. purpuratus* densities were 0.96/m<sup>2</sup> and 0.08/m<sup>2</sup>, respectively, and both similar to recent years. *Strongylocentrotus* spp. were mostly found in cracks and crevices and very few juveniles were observed. No *Lytechinus anamesus* or *Centrostephanus coronatus* were observed. No sea urchin wasting disease was observed.

*Pycnopodia helianthoides* density remained high at 0.08/m. Medium-sized *P. helianthoides* were common and large-sized individuals were rare at this site. *Patiria miniata* were relatively abundant and large with a density of 0.79/m<sup>2</sup>. *Pisaster giganteus* were abundant with densities on 1 m quadrats

and 5 m quadrats at 0.08/m<sup>2</sup> and 0.13/m<sup>2</sup>, respectively. *Parastichopus parvimensis* density was 0.25/m<sup>2</sup>, similar to previous years. No sea star wasting disease was observed.

Twenty-five *Haliotis rufescens* were found along the transect during size frequencies with a search effort covering the entire transect. Their density on band transects was similar to last year at 0.015/m<sup>2</sup>. *Haliotis rufescens* covered a large size distribution and most individuals were found in the same cracks and crevices as previous years. *Cypraea spadicea* density was 0.5/m<sup>2</sup>. No *Megastrea undosa* or *L. gibberosa* were observed. *Kelletia kelletii* were rare with a density of 0.0014/m<sup>2</sup>, similar to recent years. *Megathura crenulata* were also rare with a density of 0.0042/m<sup>2</sup>. *Crassedoma giganteum* density was 0.02/m<sup>2</sup>. No *Aplysia californica* were observed.

Fish were moderately diverse and abundant, similar to past years. *Coryphopterus nicholsii* density was 0.17/m<sup>2</sup> with up to 35 observed on the roving diver fish counts. *Oxylebius pictus* were common with a density of 0.29/m<sup>2</sup> and up to 13 observed. Several juvenile *O. pictus* were noted. Adult *Chromis punctipinnis* were common with up to 48 adults and six juveniles observed. *Oxyjulis californica* were common with up to 52 adults and 22 juveniles observed. Up to nine female, three male and two juvenile *Semicossyphus pulcher* were observed. No *Halichoeres semicinctus* were observed. Six adult *Hypsypops rubicundus* were observed which is relatively high for this site and included the male on a nest near the 72 meter mark that has been present since at least 1990. Up to three adult and one juvenile *Paralabrax clathratus* were observed. Two adult *Girella nigricans* were observed. Up to 14 adult and nine juvenile *Embiotoca jacksoni* were observed. Up to eight adult and five juvenile *Embiotoca lateralis* were observed. Five adult and three juvenile *Rhacochilus vacca* were observed. One *Rhacochilus toxotes*, rubberlip surfperch, was observed. No *Sebastes mystinus* were observed. *Sebastes atrovirens* were moderately abundant with up to 26 adults and 15 juveniles observed. One juvenile *Sebastes serriceps* was observed. Three adult *Sebastes serranoides* were observed. Up to seven adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. Three juvenile *Sebastes paucispinis*, bocaccio, were observed. One *Hypsurus caryi*, rainbow surfperch, was observed. One *Hermosilla azurea*, zebra surfperch, was observed. Up to 160 *Brachystius frenatus*, kelp surfperch, were observed. Two adult and one juvenile *Heterostichus rostratus*, giant kelpfish, were observed. A school of 71 *Cymatogaster aggregata*, shiner surfperch, was observed. Roving diver fish counts were conducted on September 26<sup>th</sup> by three divers observing 25 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was employed on September 26<sup>th</sup>.

No *Haliotis rufescens* were found in the ARMs this year, the second year in a row and only the second time since 1999 that none were observed. *Cypraea spadicea* remained moderately abundant at 8.3/ARM. Two of the *C. spadicea* had juvenile morphology. This has been observed at several of our monitoring sites throughout the islands this year in the ARMs. *Crassedoma giganteum* density was 1.3/ARM. *Patiria miniata* density remained high at 3.8/ARM, similar to recent years. *Pisaster giganteus* density was low for this site at 1.1/ARM, but similar to last year. *Pycnopodia helianthoides* density was 1.6/ARM. *Strongylocentrotus franciscanus* density remained high at 27.9/ARM. *Strongylocentrotus purpuratus* density increased to 19.9/ARM, relatively high compared

to the past five years. *Parastichopus parvimensis* less than ten centimeters were absent from the ARMs and individuals greater than ten centimeters density was 0.2/ARM. Three *Octopus rubescens* were observed, two of which had eggs, and there was one clutch of octopus eggs without an octopus present.

The temperature loggers were retrieved and deployed and data were successfully downloaded. Both loggers were recording within factory specifications of each other.

**Location: Johnson's Lee South, Santa Rosa Island**

**Site #4 SRJLSO**

**2007 sampling dates: 7/25.**

**2007 status: Mature kelp forest.**

There were some notable changes from last year. Most notable was the increase in *Macrocystis pyrifera*. *Macrocystis pyrifera* canopy cover increased to 100% from our estimate last year of 10%. The *M. pyrifera* appeared healthy with large, widely-spaced mature plants and interspersed patches of smaller plants. The bottom was scoured with an increase in bare substrate from recent years.

*Macrocystis pyrifera* cover was recorded at 7.7%, a decrease from last year and likely due to the decrease in juvenile density. Adult *M. pyrifera* density increased this year to 0.47/m<sup>2</sup>, while subadult and juvenile densities decreased to 0.075/m<sup>2</sup> and 0.21/m<sup>2</sup>, respectively. *Macrocystis pyrifera* stipe density was relatively high at 5.0/m<sup>2</sup>. *Eisenia arborea* were common on the tops of rocks. None were observed on 1 m quadrats, and cover was 0.5%. *Pterygophora californica* adults and juveniles were both common with densities of 0.04/m<sup>2</sup> and 0.42/m<sup>2</sup>, respectively, and a cover of 0.17%. *Laminaria farlowii* were common, but less abundant than last year with adult and juvenile densities at 0.17/m<sup>2</sup> and 0.0/m<sup>2</sup>, respectively and a cover of 1.5%, all lower than last year. Miscellaneous red algae cover decreased dramatically from last year to 15%. Similarly, there were notably less *Gigartina* spp. (specifically *G. corymbifera*) on the northern end of the transect with a cover of 3.7%. *Gelidium* spp. were not observed. Green algae were not observed on RPCs this year. These observed decreases in understory algae abundance may be due in part to the dense kelp canopy cover that low light conditions below. Miscellaneous brown algae cover was 1.5%. Neither *Desmarestia* spp. nor *Cystoseira* spp. were recorded on RPCs, though *Cystoseira* spp. was common. Articulated coralline and encrusting coralline algae covers were 3.3% and 14%, respectively, similar to recent years. Bare substrate cover increased to 30%.

Overall, invertebrate density was relatively low along the transect. Miscellaneous invertebrates excluding *Ophiothrix spiculata* decreased from last year to 5.0%. This category consisted mainly of hydroids, specifically *Aglaophenia struthionides*. There were no *Ophiothrix spiculata* observed on RPCs for the third consecutive year. Miscellaneous bryozoan cover remained high at 23% and *Diaperoecia californica* cover was 1.3%. Miscellaneous bryozoans that were most abundant were *Heteropora pacifica*, *Hippodiplosia insculpta* and *Membranipora* spp. Tunicates were moderately abundant with a cover of 3.5%. *Styela montereyensis* density was 0.63/m<sup>2</sup>. Sponge cover was 1.8% and *Tethya aurantia* density was similar to last year at 0.42/m<sup>2</sup>. *Astrangia lajollaensis* and *Balanophyllia elegans* covers were 1.3% and 1.5%, respectively. *Corynactis californica* cover was 1.5%. *Urticina lofotensis* density remained similar to last year at 0.18/m<sup>2</sup>. There was a notable increase in *Diopatra ornata* cover this year to 16%. *Phragmatopoma californica* was rare with a cover of 0.17%. *Lophogorgia chilensis* were common at 0.05/m<sup>2</sup>, similar to last year, but the lowest density recorded since 1984.

*Strongylocentrotus* spp. were similar to last year. *Strongylocentrotus* spp. remained rare with *S. franciscanus* and *S. purpuratus* densities at 0.58/m<sup>2</sup> and 0.25/m<sup>2</sup>, respectively. Similar to recent years, all *Strongylocentrotus* spp. were confined to the cracks and crevices. There were no

*Centrostephanus coronatus* or *Lytechinus anamesus* observed. No sea urchin wasting disease was observed.

*Pisaster giganteus* were rare on 1 m quadrats and 5 m quadrats with densities of 0.04/m<sup>2</sup> and 0.02/m<sup>2</sup>, respectively. *Patiria miniata* densities was similar to recent years at 3.8/m<sup>2</sup>. *Parastichopus parvimensis* densities was 0.13/m<sup>2</sup>. No sea star wasting disease was observed.

*Haliotis rufescens* density remained low at 0.0042/m<sup>2</sup> and five were found for size frequencies with a mean size of 151 mm. Two fresh *H. rufescens* shells were found and measured at 69 mm and 157 mm. *Cypraea spadicea* density was 0.08/m<sup>2</sup> and *Kelletia kelletii* was 0.035/m<sup>2</sup>. *Crassedoma giganteum* density was similar to last year at 0.013/m<sup>2</sup>. *Megathura crenulata* were rare with a density of 0.0010/m<sup>2</sup>.

As observed in recent years, *Phyllolithodes papillosus*, heart crabs, were observed at this site in the ARMs. *Phyllolithodes papillosus* are typically found in the cooler northern waters, and we suspect the population here at Johnson's Lee is a range extension. See notes below for more detail.

Overall, observations of the fish at this site were similar to last year with fish remaining abundant and divers at this site. *Coryphopterus nicholsii* density was relatively high at 1.3/m<sup>2</sup> and up to 45 observed on the roving diver fish counts. *Oxylebius pictus* density was 0.25/m<sup>2</sup> and up to 29 were observed. The most abundant fish at this site was *Oxyjulis californica* with up to 274 adults and no juveniles observed. *Chromis punctipinnis* were rare this year with up to five adults and no juveniles observed. Five female, no juvenile and two male *Semicossyphus pulcher* were observed. There were no *Halichoeres semicinctus* observed, same as last year. There were up to eight adult and three juvenile *Embiotoca jacksoni* observed. Up to 22 adult and one juvenile *Embiotoca lateralis* were observed. Up to 23 *Rhacochilus vacca* adults and 19 *R. toxotes*, rubberlip surfperch, adults were observed. There were up to seven adult *Girella nigricans* observed. *Paralabrax clathratus* were relatively common for this site with up to 12 adults observed. Eight adult and nine juvenile *Sebastes mystinus* were counted. *Sebastes serranoides* were present with six adults and five juveniles observed. Up to 26 adult and no juvenile *Sebastes atrovirens* were observed. Up to five adult and seven juvenile *Sebastes serriceps* were observed. One adult *Sebastes carnatus*, gopher rockfish, and one adult *Sebastes caurinus*, copper rockfish, were observed. Up to eight adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. One juvenile *Sebastes miniatus*, vermillion rockfish, and one juvenile *Sebastes paucispinis*, bocaccio, were observed. There were up to 17 KGB observed. Eight adult *Hypsurus caryi*, rainbow surfperch, were counted. *Brachyistius frenatus*, kelp surfperch, were present with up to 32 adults observed. *Medialuna californiensis*, halfmoon, were less common than previous years with up to three observed. One *Caulolatilus princeps*, ocean whitefish, was observed. There were schools of both *Atherinops affinis*, topsmelt, and *Trachurus symmetricus*, jack mackerel, present of up to 30 and 25 observed, respectively. Up to two *Myliobatis californica*, bat ray, were observed. Roving diver fish counts were performed on July 25<sup>th</sup> with four divers observing 30 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was employed on September 19<sup>th</sup>.

All seven ARMs were monitored for all indicator species. Since 1997 we have observed *Phyllolithodes papillosus*, heart crabs, in the ARMs at this site. This year, four were observed during sampling. Two small *Brosmophycis marginata*, red brotula, were also observed. One medium sized *Octopus* spp. was observed. One *Haliotis rufescens* was observed in the ARMs for a density of 0.14/ARM and measured at 35 mm. *Cypraea spadicea* density was 6.43/ARM, similar to last year. Two of the *C. spadicea* were juveniles. Four *Megathura crenulata* were observed for a density of 0.57/ARM and average size of 34 mm. *Crassedoma giganteum* density was 1.1/ARM, relatively high for this site for the second consecutive year. No *Kelletia kelletii* were observed. *Patiria miniata* density and mean size were observed at 9.0/ARM and 33.9 mm, respectively. *Pisaster giganteus* density was 3.7/ARM with a mean size of 34 mm, similar to past years. *Pycnopodia helianthoides* density was 5.3/ARM, the highest recorded in the ARMs here since we began monitoring the ARMs in 1993. Their mean size was 61 mm, smaller than last year. *Strongylocentrotus franciscanus* density was 40/ARM with a mean size of 52 mm, similar to last year. *Strongylocentrotus purpuratus* density was 11/ARM with a mean size of 28 mm, also similar to last year. No *Centrostephanus coronatus* or *Lytechinus anamesus* were observed. No *Parastichopus parvimensis* less than ten centimeters were observed in the ARMs, same as last year. *Parastichopus parvimensis* greater than ten centimeters were rare at 0.17/ARM.

The temperature loggers were retrieved and deployed and all data was successfully downloaded from the logger at the north end of the transect. The temperature logger at this site was originally placed at the south end of the transect and we are in the process of trying to move it to the north end.

Currently, we have temperature loggers at either ends to test whether or not both ends of the transect are similar in temperature, and if they are, we plan to permanently move the logger to the north end to stay consistent with the other monitoring sites. In 2007, the temperature logger retrieved from the south end was not operational, thus there will be no comparison made between the north and south ends this year. We have chosen to continue deploying both north end and south end loggers again for another year.

**Location: Rodes Reef, Santa Rosa Island**

**Site #5 SRRR**

**2007 sampling dates: 7/9, 7/10.**

**2007 status: Mature kelp forest.**

This site changed dramatically from being nearly devoid of *Macrocystis pyrifera* to a maturing kelp forest with widely spaced large adult plants. In addition juvenile and subadult *M. pyrifera* were common. Canopy cover of *M. pyrifera* was estimated at 40%. Adult, subadult, and juvenile densities were 0.12/m<sup>2</sup>, 0.08/m<sup>2</sup> and 0.21/m<sup>2</sup>, respectively, and cover was 2.8%, all increases from last year.

*Macrocystis pyrifera* stipe density was 2.9/m<sup>2</sup>. No *Eisenia arborea*, *Pterygophora californica*, *Laminaria farlowii*, *Cystoseira* spp. or *Desmarestia* spp. were observed, similar to last year.

Miscellaneous brown algae cover was 0.17%. Miscellaneous red algae were common with a cover of 26% and some were often growing epiphytically on *Diopatra ornata*. *Gigartina corymbifera* were rare this year and *Gigartina* spp. cover decreased to 0.5%. Similar to last year, no miscellaneous plants were observed on RPCs. Articulated coralline algae were rare with a cover of 0.17%.

Encrusting coralline algae cover was low for this site at 21%. Bare substrate increased to 9.7%. Sand also increased to 7.8% while cobble and rock cover remained similar to last year at 15% and 77%, respectively.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 21%, similar to recent years. The most common miscellaneous invertebrates were hydroids and amphipod tube mats. *Diopatra ornata* were moderately abundant at the east end with a cover of 10%. *Balanophyllia elegans* cover was 1.2%, lower than last year but similar to previous years. *Corynactis californica* were common but none were observed during RPCs. *Astrangia lajollaensis* cover was 7.2%, similar to past years.

*Balanophyllia elegans* and *A. lajollaensis* were most abundant from 50-100 meters along the transect. Miscellaneous bryozoan cover remained high with a cover of 15%. The bryozoans were abundant and diverse and included large patches of *Costanzia costazi*, *Membranipora* spp., and *Hippodiplosia insculpta*, the fluted bryozoan. *Diaperocia californica* was common on the sides of large rocks off the main transect and had a cover of 1.3%. *Urticina lofotensis* density was 0.07/m<sup>2</sup>, similar to past years. *Telia coriacea* and *Telia colombiana* were also common, as is typical for this site.

*Lophogorgia chilensis* were rare with several observed along the transect but none on band transects. Sponge cover was 1.0%. *Leucosolenia eleanor*, were notably abundant and large. *Tethya aurantia* were abundant at 0.25/m<sup>2</sup>, similar to past years. *Craniella arb*, the gray puffball sponge, was common. *Styela montereyensis* were common with a density of 0.25/m<sup>2</sup>. Tunicate cover was high at 7.5%.

*Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* densities were 1.9/m<sup>2</sup> and 0.08/m<sup>2</sup>, respectively; both low for this site. *Strongylocentrotus* spp. were notably large and confined to the crevice habitat. Juvenile *Strongylocentrotus* spp. were rare. *Lytechinus anamesus* were rare 0.004/m<sup>2</sup>, the first time they have been observed on band transects since 2000. No sea urchin wasting disease was observed.

No *Ophiothrix spiculata* were observed on RPCs. *Patiria miniata* density remained high at  $4.9/\text{m}^2$ . *Pisaster giganteus* were counted on both 1 m quadrats and 5 m quadrats, with densities of  $0.38/\text{m}^2$  and  $0.16/\text{m}^2$ , respectively. *Pycnopodia helianthoides* density was  $0.08/\text{m}^2$ , similar to past years. Large *Parastichopus parvimensis* were present in low abundance on the rocky western half of the transect, but none were observed during 1 m quadrats this year. These continue to be some of the largest *P. parvimensis* we have observed anywhere at the Channel Islands. No sea star wasting disease was observed this year.

No live *Haliotis* spp. were observed this year. Three small fresh *H. rufescens* shells were found measuring 33 mm, 35 mm and 58 mm. One old *H. assimilis* was found and measured at 116 mm. This shell may be the remains of the live *H. assimilis* observed several years ago at this site. *Kelletia kelletii* density was  $0.075/\text{m}^2$ , similar to past years. Most were large, but several small (less than 50 mm) individuals were observed. No *Megastraea undosa* were observed at the site and *Lithopoma gibberosa* were rare at  $0.04/\text{m}^2$ . *Megathura crenulata* density increased to  $0.02/\text{m}^2$ , but was similar to past years, and most *M. crenulata* were present on the rocky western end of the transect. *Aplysia californica* density was  $0.0056/\text{m}^2$ .

With the return of a kelp forest, there was an increase in fish diversity and abundance at this site. *Coryphopterus nicholsii* continued to decrease with none observed on 1 m quadrats and seven counted on the roving diver fish counts. *Oxylebius pictus* density was  $0.17/\text{m}^2$ , and up to 35 were observed. Up to five adult *Chromis punctipinnis* were observed, similar to last year. Up to 35 *Oxyjulis californica* were observed. Five female, two male, and no juvenile *Semicossyphus pulcher* were observed. Up to nine adult and one juvenile *Paralabrax clathratus* were observed. There were noticeably more *Embiotoca* spp. and *Sebastodes* spp. than last year. Five adult and four juvenile *Embiotoca jacksoni* were observed. *Embiotoca lateralis* were abundant with up to 25 adults and 20 juveniles observed. Up to 12 adult *Rhacochilus vacca* were observed. *Sebastodes mystinus* were common with up to 33 adults observed, most notably large. *Sebastodes atrovirens* were abundant with up to 44 adults and one juvenile observed. *Sebastodes caurinus*, copper rockfish, adults were common with up to 10 observed; several juveniles were noted after the fish count. *Sebastodes melanops*, black rockfish, were common and large with up to 10 adults observed, notably more of this species than we usually observe. *Sebastodes chrysomelas*, black and yellow rockfish, were common with up to eight adults observed. Two juvenile *Sebastodes miniatus*, vermillion rockfish, were observed, similar to other sites this year. Up to seven KGB were observed. Two *Ophiodon elongatus*, lingcod, were observed. Up to five adult *Hypsurus caryi*, rainbow surfperch, and 10 adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. *Aulorhynchus flavidus*, tubesnouts, were very abundant with up to 1700 observed. Two ronquils believed to be *Ronquilus jordani*, northern ronquils, were observed. Roving diver fish counts were conducted on July 9<sup>th</sup> by five divers observing 29 species of fish.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Gull Island, Santa Cruz Island****Site #6 SCGI****2007 sampling dates: 7/23, 7/24.****2007 status: Mature kelp forest.**

This site continued to be a mature kelp forests and canopy cover was estimated at 50% and was relatively thin with a moderate amount of understory algae. . Most of the *Macrocystis pyrifera* were healthy, although some appeared tattered and had a moderate amount of *Membranipora* spp. growing on blades. Most adult *M. pyrifera* were small and there were fewer large widely spaced kelp plants than last year. *Macrocystis pyrifera* cover was 25.0% and adult, subadult and juvenile densities were similar to recent years at 0.30/m<sup>2</sup>, 0.25/m<sup>2</sup> and 0.42/m<sup>2</sup>, respectively. *Macrocystis pyrifera* stipe density was 5.0/m<sup>2</sup>. *Eisenia arborea* cover was 0.67% with adult and juvenile densities at 0.0/m<sup>2</sup>, and 0.25/m<sup>2</sup>, respectively. *Pterygophora californica* were common in the low lying areas with a cover of 0.5%, but none were observed on 1 m quadrats, similar to past years. *Laminaria farlowii* were common, but none were observed on 1 m quadrats or RPCs. *Agarum fimbriatum* was common. Several small *Cystoseira* spp. were observed within the transect area and had a cover of 0.5%. Miscellaneous red algae continued to increase to 58%, the highest recorded at this site since we began monitoring in 1982. This category consisted mostly of *Rhodymenia* spp. Green algae and miscellaneous brown algae covers were 0.5% and 0.17%, respectively. Articulated coralline algae and encrusting coralline algae covers were 4.2% and 23%, respectively. Bare substrate cover remained low at 1.3%.

Similar to last year, the most common Miscellaneous Invertebrates excl. *Ophiothrix spiculata*, were hydroids, and had a cover of 12.0%. Overall, encrusting invertebrates were notably more abundant and diverse than in recent years. Tunicate cover was similar to last year at 3.8%. *Styela montereyensis* density was 0.04/m<sup>2</sup>. *Tethya aurantia* were common with a density of 0.2/m<sup>2</sup>. Other sponges were common with a cover of 3.3%. Several species were observed including *Hymenamphiastra cyanocrypta*, the cobalt sponge. *Corynactis californica* cover was 2.5%, similar to recent years. The cup corals, *Balanophyllia elegans* and *Astrangia lajollaensis*, covers were 2.7% and 1.5%, respectively. *Diopatra ornata* cover was 2.7%. Bryozoans were relatively abundant this year. *Diaperoecia californica* cover was 7.3%. Miscellaneous bryozoans increased in abundance to 30% cover and included *Costanzia* spp. and *Heteropora* spp. *Diaperoecia californica*. Small and large colonies of *Stylaster californica* were relatively abundant for this site and their density notably increased to 0.13/m<sup>2</sup>, the highest recorded density for this species since we began monitoring it in 1983. *Lophogorgia chilensis* density remained low at 0.026/m<sup>2</sup>, and many appeared unhealthy.

*Strongylocentrotus* spp. continued to have relatively low densities. *Strongylocentrotus franciscanus* and *S. purpuratus* densities increased slightly from last year but remain low at 1.3/m<sup>2</sup> and 2.1/m<sup>2</sup>, respectively. Most of the *S. franciscanus* were notably large, and both small and large *S. purpuratus* were present. No *Centrostephanus coronatus* or *Lytechinus anamesus* were observed during sampling. No sea urchin wasting disease was observed. Similar to last year, there were several small clusters of *S. purpuratus* tests found throughout the site that appeared to be a result of predation by *Pycnopodia helianthoides*.

*Pisaster giganteus* were counted on both 1 m quadrats and 5 m quadrats with densities of 0.46/m<sup>2</sup> and 0.22/m<sup>2</sup>, respectively. *Patiria miniata* remained relatively abundant with a density of 2.6/m<sup>2</sup>. *Pycnopodia helianthoides* were common at 0.017/m<sup>2</sup>. Most *P. helianthoides* were medium-sized, though a few small and large individuals were also observed. *Mediaster aequalis* and *Henricia aspersa* were both common at this site. *Parastichopus parvimensis* density was 0.21/m<sup>2</sup>. No *Pachythyone rubra* were observed on RPCs. No sea star wasting disease was observed.

One *Haliotis assimilis* measuring 70 mm was observed and was located about two meters offshore of the transect at meter 17 along the transect line. *Cypraea spadicea* density was 0.54/m<sup>2</sup>. Neither *Lithopoma undosa* nor *L. gibberosa* were observed during 1 m quadrats, however, there were a few *L. undosa* observed during size frequencies. *Tegula regina* were not observed at this site, which is a very dissimilar observation to last year when *T. regina* were the most abundant large snail present at this site. *Megathura crenulata* were not observed for the third consecutive year, and this is the seventh year of a steady decline in *M. crenulata* abundance. *Aplysia californica* were not observed this year. *Kelletia kelletii* density was 0.01/m<sup>2</sup> and most individuals were large. *Crassedoma giganteum* density also remained low at 0.01/m<sup>2</sup>.

Fish at this site were moderately diverse and abundant. *Coryphopterus nicholsii* density was 0.54/m<sup>2</sup>, similar to past years, and up to 27 were observed during the fish count. *Oxylebius pictus* were abundant with up to 50 observed and a density of 0.38/m<sup>2</sup>. *Chromis punctipinnis* were the most abundant fish with up to 176 adults and no juveniles observed. *Oxyjulis californica* were moderately abundant with up to 116 adults observed. Up to 18 female, 10 juvenile and 10 male *Semicossyphus pulcher* were observed, similar to recent years. No *Halichoeres semicinctus* were observed. Three adult *Hypsypops rubicundus* were recorded during the fish count. Up to seven adult *Paralabrax clathratus* were observed, but no juveniles. *Embiotoca jacksoni* were common with up to nine adults and four juveniles observed. Up to four adult and five juvenile *Embiotoca lateralis* were observed. There were up to two adult and three juvenile *Rhacochilus vacca* observed. Three adult *Girella nigricans* were observed. *Sebastes mystinus* were present with up to five adults and 46 juveniles observed. *Sebastes atrovirens* were moderately abundant with up to 14 adults and three juveniles observed. Up to four adult and 11 juvenile *Sebastes serranoides* were observed. One adult and one juvenile *Sebastes serriceps* were observed. One *Sebastes carnatus*, gopher rockfish, and up to four *Sebastes chrysomelas*, black and yellow rockfish, were observed. Juvenile rockfish were common at the site this year. There were up to 18 KGB observed. One *Sebastes rosaceous*, rosy rockfish, was observed during the fish count, an unusual observation for this deeper water species. A juvenile *Sebastes pinniger*, canary rockfish, was present at the site, but not observed during the fish count. The large adult *Sebastes caurinus*, copper rockfish, which had been observed the past two years, was not observed. *Brachistius frenatus*, kelp surfperch, were common in the kelp canopy with up to 15 observed. A small school of 15 *Atherinops affinis*, topsmelt, was present. Several *Ophiodon elongatus*, lingcod, were noted throughout the day while sampling, but only one adult was observed during the fish count. One *Myliobatis californica*, bat ray, and one *Cephaloscyllium ventriosum*,

swell shark, were observed.. Roving diver fish counts were conducted on July 23<sup>rd</sup> with five divers observing 29 species.

All 14 ARMs were monitored for all indicator species. Unfortunately the animals in ARM# 2391 were lost during replacement after performing size frequency measurements topside. The diver in charge of replacing these animals dropped the mesh bag containing them and the bag was never found. On the north end of the transect, two of the cages had their bottom layer of bricks covered by sand and one ARM cage was observed with the bottom brick layered by tube worms, presumably *Chaetopterus* spp. There were no *Haliotis* spp. observed for the third consecutive year. Thirteen of the 14 ARMs housed juvenile *Cypraea spadicea*. The density of *C. spadicea* remained high and was 12.2/ARM, similar to recent years. One *Kelletia kelletii* was for a density of 0.07/ARM. No *Lithopoma undosa* or *Lithopoma gibberosa* were observed. *Megathura crenulata* density was 0.5/ARM and all were less than 40 mm. *Crassedoma giganteum* density was 1.9/ARM with an average size of 36 mm. *Tegula regina* density was low at 0.14/ARM. *Patiria miniata* density was similar to last year at 6.2/ARM. The mean *P. miniata* size was relatively small at 20 mm, indicative of recent recruitment. *Pisaster giganteus* density was higher than last year at 3.4/ARM and mean size was relatively small at 40 mm. *Pycnopodia helianthoides* density was the same as the last two years at 0.21/ARM with a mean size of 170 mm. *Strongylocentrotus franciscanus* density was 52/ARM, higher than recent years, but with a similar mean size of 28 mm. This density is the second highest recorded since ARM sampling began at this site and is almost double the number observed last year. *Strongylocentrotus purpuratus* also increased in density to 12.6/ARM, but had a similar mean size of 19 mm. No *Centrostephanus coronatus* were observed. *Parastichopus parvimensis* density less than ten centimeters was low compared to recent years at 0.14/ARM and remained low for individuals greater than ten centimeters at 0.21/ARM. . One *Octopus* spp. was observed. There was an abundance of *Hymenamphiastra cyanocrypta* covering several of the ARM bricks.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Fry's Harbor, Santa Cruz Island**

**Site #7 SCFH**

**2007 sampling dates: 7/27, 8/16, 9/11.**

**2007 status: Developing kelp forest.**

This site continues to change and more macroalgae was present than in about the past 20 years. Several canopy forming *Macrocystis pyrifera* adults were observed, but most were subadults, and juveniles were rare. Their densities were  $0.005/m^2$ ,  $0.045/m^2$  and  $0.0/m^2$  respectively, and had a cover of 1.7%, all some of the highest ever recorded at this site. *Macrocystis pyrifera* stipe density was  $0.58/m^2$ . There were 52 *M. pyrifera* plants found within the transect area for size frequencies, in 2006 there were only three plants. *Eisenia arborea* was the most abundant large macroalgae at the site. *Eisenia arborea* adults and juveniles were very abundant with densities of  $0.96/m^2$  and  $1.1/m^2$ , respectively and the highest recorded at this site since we began monitoring them in 1996. *Eisenia arborea* cover continued to increase for the fourth consecutive year and was 21%, the highest cover recorded at this site. No *Pterygophora californica* was observed at the site. Several small *Laminaria farlowii* were observed, but none on 1 m quadrats or RPCs. Several small *Cystoseira* spp. were observed but none on RPCs. *Gigartina* spp. cover was 2.0%, and consisted of *G. corymbifera*. Miscellaneous red algae remained moderately abundant with a cover of 26%. Miscellaneous green algae cover was 1.7% and consisted mostly of *Codium* spp. and filamentous green algae. Miscellaneous brown algae cover was 0.2%. Miscellaneous plants, consisting of filamentous diatoms, were recorded at 3.0%. Encrusting coralline algae cover remained similar to previous years at 34%. Articulated coralline algae were rare for a cover of 0.3%. Bare substrate cover was 9.0%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* were abundant with a cover of 27%, an increase from last year. The most common miscellaneous invertebrates in this category were *Clavularia* spp. and hydroids. Tubeworms such as *Spirobranchus spinosus* and *Spirorbis* spp. were also moderately abundant. *Diopatra ornata* cover was 0.17%, similar to past years. *Balanophyllia elegans* were not observed on RPCs. *Astrangia lajollaensis* cover remained low at 5.5%. *Corynactis californica* cover was 0.83%, similar to past years. Bryozoans were noticeably abundant, similar to last year. Miscellaneous bryozoans continued to increase to 22% cover, the highest recorded at this site since the monitoring of this category began in 1985. The most notable bryozoans were *Bugula californica* and *Membranipora* spp. *Diaperoecia californica* were abundant on the sides of large boulders and cover was 1.5%. *Lophogorgia chilensis* were abundant on the offshore side of the transect and had a density of  $0.24/m^2$ , similar to recent years. *Tethya aurantia* density was relatively high at  $0.05/m^2$ , with many small individuals present. Miscellaneous sponges cover was 0.33%, similar to past years. Tunicate cover increased to 2.2%, the highest ever recorded at this site.

*Strongylocentrotus purpuratus* and *S. franciscanus* densities remained low for the fourth consecutive year at  $0.21/m^2$  and  $0.13/m^2$ , respectively. With a moderate amount of effort, only 59 *S. franciscanus* and 19 *S. purpuratus* were located for size frequency measurements, indicating low abundances over the entire transect. *Lytechinus anamesus* continued to be rare. One *Lytechinus anamesus* was recorded on band transects for a density of  $0.0014/m^2$ , and only one was found for size frequencies.

*Centrostephanus coronatus* density remained low with none observed during sampling for the fourth consecutive year. No sea urchin wasting disease was observed.

*Pisaster giganteus* density on 1 m quadrats and 5 m quadrats were 0.25/m<sup>2</sup> and 0.27/m<sup>2</sup>, respectively, similar to last year. *Patiria miniata* density remained high for this site and increased to 2.3/m<sup>2</sup>, the highest recorded since monitoring began here. *Parastichopus parvimensis* density remained relatively low at 0.08/m<sup>2</sup>. *Pycnopodia helianthoides* continued to be relatively abundant for this site at a density of 0.031/m<sup>2</sup>. *Ophiothrix spiculata* were rare along the transect with a cover of 0.17%, similar to last year. *Pachythyone rubra* continued to be rare with none recorded on RPCs. Only one small patch and one larger patch estimated at 3 x 3 m were observed this year. The larger patch was inshore of the site on the north end of the transect. No sea star wasting disease was observed during the June sampling event, but one diseased *Pisaster giganteus* was observed during on September 11<sup>th</sup>.

*Cypraea spadicea* were common with a density of 0.38/m<sup>2</sup>. *Megastraea undosa* continued to be rare with a density of 0.13/m<sup>2</sup>, similar to recent years. Only seven were found for size frequencies with a moderate search effort and most were medium-sized individuals. *Lithopoma gibberosa* were rare at 0.08/m<sup>2</sup>, with only several small ones observed at the site. No *Aplysia californica* were observed on band transects. *Megathura crenulata* density remained similar to recent years and was 0.078/m<sup>2</sup>. *Crassedoma giganteum* density remained similar to past years at 0.035/m<sup>2</sup>. *Kelletia kelletii* were rare and recorded at 0.0042/m<sup>2</sup>. No *Panulirus interruptus* were observed along the transect, similar to past years.

We were able to conduct roving diver fish counts at this site twice this year. The counts are reported with the highest number recorded. If there was a large discrepancy between counts we stated it accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Similar to past years, fish diversity and abundance were high at this site. *Coryphopterus nicholsii* were relatively abundant at 3.8/m<sup>2</sup>. Up to 568 *C. nicholsii* were observed and we observed notably more during the September 11<sup>th</sup> fish count. *Alloclinus holderi* density was 0.29/m<sup>2</sup>, and up to 17 were observed. *Lythrypnus dalli* were abundant with a density of 0.5/m<sup>2</sup> and up to 235 counted. Very small juvenile *L. dalli* were common. *Oxylebius pictus* were common with a density of 0.08/m<sup>2</sup> and up to 30 observed. *Chromis punctipinnis* were the most abundant fish at this site with up to 583 adults and 42 juveniles observed. Up to 51 adult and 88 juvenile *Oxyjulis californica* were observed. Six female, three male and six juvenile *Halichoeres semicinctus* were observed. Up to five female, two male and four juvenile *Semicossyphus pulcher* were observed. *Hypsypops rubicundus* were common with up to six adults observed. *Paralabrax clathratus* were common with up to 17 adult and eight juveniles observed. Up to 31 adult and 17 juvenile *Embiotoca jacksoni* were observed. *Rhacochilus vacca* were abundant with up to 10 adults and 31 juveniles observed. No *Embiotoca lateralis* were observed at this site. Up to seven *Girella nigricans* were observed. Similar to last year, *Sebastes* spp. were abundant at this site. *Sebastes mystinus* young of the year were common with up to nine

juveniles observed and no adults. Two adult and five juvenile *Sebastes serranoides* were observed. *Sebastes atrovirens* juveniles were very abundant with up to 306 observed and up to three adults observed. This is a notable recruitment event for this species. *Sebastes serriceps* were abundant with up to 13 adults and eight juveniles observed. *Sebastes carnatus*, gopher rockfish, were common with up to seven adults and one juvenile observed. Six adult *Sebastes caurinus*, copper rockfish, were observed. Seven adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. Up to five *Medialuna californiensis*, halfmoon, were observed. Twelve adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. One *Caulolatilus princeps*, ocean whitefish, was observed. One *Scorpaenichthys marmoratus*, cabezon, was observed. Up to five *Lythrypnus zebra*, zebra goby, were observed. *Orthopias triacus*, snubnose sculpin, were observed. Two *Gymnothorax mordax*, California moray eel, were observed. One *Ophiodon elongatus*, lingcod, was observed. One *Myliobatis californica*, bat ray, was observed. Roving diver fish counts were performed on July 27<sup>th</sup> by five divers observing 32 species and on September 11<sup>th</sup> with six divers observing 25 species.

All five ARMs were intact and monitored for all indicator species, though #2434 rolled down the slope to a depth of 54 ft. This one was moved back into shallower water and two cages (ARM #2433 and #2434) were replaced. No *Haliotis* spp. were found in the ARMs. *Cypraea spadicea* were abundant at 11.2/ARM, two of which had juvenile morphology. *Megathura crenulata* were common with a density of 1.2/ARM. *Crassedoma giganteum* density was higher than recent years at 4.4/ARM. *Patiria miniata* density was similar to recent years at 8.6/ARM and mean size 43 mm. *Pisaster giganteus* density was 1.0/ARM. One *Megastraea undosa* density was 0.2/ARM. *Strongylocentrotus franciscanus* density was 14.0/ARM, similar to last year. *Strongylocentrotus purpuratus* density increased from last year to 5.0/ARM. *Parastichopus parvimensis* density less than ten centimeters was 1.2/ARM and density greater than ten centimeters was also 1.2/ARM, similar to recent years.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Pelican Bay, Santa Cruz Island**

**Site #8 SCPB**

**2007 sampling dates: 6/18, 6/19, 8/16, 9/5.**

**2007 status: Dominated by *Strongylocentrotus purpuratus*.**

This site continues to be dominated by *Strongylocentrotus purpuratus* though densities have declined in recent years. The site is mostly devoid of macroalgae, however a kelp forest is developing at the southern end of the bay. There were more algae present than in recent years. Two adult *Macrocystis pyrifera* were within the transect for size frequency measurements, though none were observed on 1 m quadrats, 5 m quadrats or RPCs. These plants were located at the southern end of the transect and were part of the developing kelp forest there. This is the first time since 1995 we have observed plants along the transect. *Pterygophora californica*, *Cystoseira* spp., *Desmarestia* spp. and *Gigartina* spp. were not observed during sampling. Several small *Eisenia arborea* juveniles were observed, as well as one juvenile and one large adult *Laminaria farlowii*, but none were observed during sampling. The most abundant algae at the site were *Dictyota/Pachydictyon* spp. on the tops of rocks. Some adult *Sargassum muticum* was present as usual at this site. Miscellaneous brown algae cover increased to 1.2%. Miscellaneous red algae cover also increased to 4.8%. Miscellaneous plants, consisting of filamentous brown diatoms, cover was 21%. Articulated coralline algae were rare with a cover of 0.17%, similar to recent years. Articulated coralline algae were rare at 0.17%. Encrusting coralline algae cover was 44%. Bare substrate cover was 40%, similar to past years.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 5.5%, with hydroids being the most commonly observed species in this category. *Diaperocenia californica* were relatively rare directly along the transect with a cover of 0.33%. Other bryozoans were common and cover increased to 4.8%. *Tethya aurantia* continued to be relatively common for this site with a density of 0.02/m<sup>2</sup>. *Balanophyllia elegans* were rare with a 0.17% cover. *Astrangia lajollaensis* were common with a cover of 7.7%, similar to past years. *Corynactis californica* cover was 0.67%. *Muricea californica* were rare with a density of 0.0014/m<sup>2</sup>. *Lophogorgia chilensis* remained abundant with a density of 0.14/m<sup>2</sup>.

*Strongylocentrotus purpuratus* density continued to decrease for the sixth consecutive year and was 9.2/m<sup>2</sup>, the lowest recorded since 1993. *Strongylocentrotus franciscanus* density increased slightly from its record low last year to 2.0/m<sup>2</sup>. Juvenile *S. franciscanus* and *S. purpuratus* were rare. *Lytechinus anamesus* were counted on both 1 m quadrats and band transects with densities of 2.7/m<sup>2</sup> and 1.3/m<sup>2</sup>, respectively, similar to recent years. Most of the *L. anamesus* were large in size. *Centrostephanus coronatus* density was 0.04/m<sup>2</sup>. One *S. purpuratus* was observed with wasting disease during the June sampling event.

*Patiria miniata* density remained similar to recent years at 0.29/m<sup>2</sup>. *Pisaster giganteus* were counted on both 1 m quadrats and 5 m quadrats with densities of 0.0/m<sup>2</sup> and 0.05/m<sup>2</sup>, respectively. No *Pycnopodia helianthoides* were during sampling. No *Ophiothrix spiculata* were observed. *Parastichopus parvimensis* density was relatively high at 0.5/m<sup>2</sup>. There were noticeably more *Pachythylene rubra* this year, with a cover of 2.7%, the highest recorded since monitoring began at

this site in 1982. One *Patiria miniata* with wasting disease was observed during the August sampling event.

*Crassedoma giganteum* density was 0.061/m<sup>2</sup>, similar to recent years. *Aplysia californica* density was 0.014/m<sup>2</sup>. *Lithopoma undosa* density continued to be very low for this site with none recorded on 1 m quadrats and only twelve found at the entire site for size frequency measurements. *Kelletia kelletii* density was 0.0042/m<sup>2</sup>, similar to past years.

We were able to conduct roving diver fish counts two times at this site. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

For a site dominated by *Strongylocentrotus purpuratus*, fish continue to be moderately abundant and diverse. *Coryphopterus nicholsii* were the most abundant fish at this site, although their density decreased to 2.5/m<sup>2</sup> and up to 570 observed. *Lythrypnus dalli* density was 0.5/m<sup>2</sup> and up to 132 were observed.. This is the first time this species was observed on 1 m quadrats since 2001. One very small juvenile *L. dalli* was observed on August 16<sup>th</sup>, indicating some recent recruitment. *Alloclinus holderi* density continued to be low at 0.0/m<sup>2</sup> with up to four observed. *Oxylebius pictus* were rare with four observed. Up to 60 adult and seven juvenile *Chromis punctipinnis* were observed. *Oxyjulis californica* were uncommon with 13 adults observed. Three female, one juvenile and no male *Semicossyphus pulcher* were observed. Up to six female, six juvenile and four male *Halichoeres semicinctus* were observed. *Paralabrax clathratus* were moderately abundant with up to 17 adults and three juveniles, but less abundant than usual for this site. Up to 14 adult *Hypsypops rubicundus* were observed. *Embiotoca jacksoni* counts were similar to past years with up to 19 adults and four juveniles observed. Similar to past years, no *Embiotoca lateralis* were observed. *Rhacochilus vacca* were abundant with up to 31 adults observed. This site had very few *Sebastes* spp. present. Four adult *Sebastes atrovirens* were observed. Up to two adult and two juvenile *S. serriceps* were observed. Eighteen adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. Three *Medialuna californiensis*, halfmoon, were observed. Two adult *Caulolatilus princeps*, ocean whitefish, were observed. One *Balistes polylepis*, finescale triggerfish, was observed, this being the first sighting of this rare fish since 2001. Three *Lythrypnus zebra*, zebra goby, were observed. Two *Myliobatis californica*, bat ray, were observed. Fringeheads are commonly observed at this site. Ten *Neoclinus stephensae*, yellowfin fringehead, and one *N. uninotatus*, onespot fringehead, were observed. These are very cryptic fish and often missed by fish counters. A school of approximately 3,000 *Sardinops sagax*, pacific sardine, was observed. Roving diver fish counts were conducted on June 18<sup>th</sup> with four divers observing 24 species and on August 16<sup>th</sup> with five divers observing 21 species.

All six ARMs were intact and sampled for all indicator species. One ARM (#2316) was found on its side and two ARMs cages (#2315 and #2318) were replaced. One *Octopus* spp. was found with eggs in the ARMs. No *Haliotis* spp. have been found in the ARMs at this site since 1999. *Cypraea spadicea* density decreased this year to 3.5/ARM, relatively low for this site. *Megastraea undosa* density was 0.67/ARM. *Megathura crenulata* were relatively common in the ARMs at 1.2/ARM, an

increase from past years. *Crassedoma giganteum* density was 3.2/ARM. *Patiria miniata* were relatively abundant in the ARMs at 13.5/ARM, the highest density since we began monitoring ARMs here in 1994. *Pisaster giganteus* were not present in the ARMs. No *Lytechinus anamesus* were observed. *Strongylocentrotus franciscanus* density nearly doubled since last year to 17.8/ARM and mean size remained similar at 33.9 mm. *Strongylocentrotus purpuratus* density also increased from last year's record low to 14.7/ARM with a mean size of 30.9 mm. No *Centrostephanus coronatus* have been observed in ARMs at this site since 2000. The density of *Parastichopus parvimensis* individuals less than 10 centimeters was 1.5/ARM and individuals greater than ten centimeters was 2.3/ARM.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Scorpion Anchorage, Santa Cruz Island**

**Site #9 SCSA**

**2007 sampling dates: 9/5, 9/13.**

**2007 status: Dominated by *Strongylocentrotus purpuratus*.**

This site continued to be dominated by *Strongylocentrotus purpuratus*, but there was a noticeable increase in macroalgae, especially *Macrocystis pyrifera*, at the west end of the transect. *Macrocystis pyrifera* was abundant on top of a large rock at meter 65 along the transect and at the western most end. The *M. pyrifera* consisted mostly of subadult *M. pyrifera*, with scattered adults, and a kelp canopy beginning to form. Although there was a notable increase at these locations, the rest of the site remained mostly devoid of macroalgae. One fresh fishing lure and one pole spear were found at this site, a designated no-take Marine Reserve and these devices indicate potential illegal fishing activity. Adult *M. pyrifera* density was  $0.02/m^2$ , the first record of adult plants since 1995. Subadult *M. pyrifera* density was recorded at  $0.22/m^2$ , the highest recorded for this category since at least 1985 and no juveniles were observed though they were present off the western end of the transect.

*Macrocystis pyrifera* cover was 3.5%, the highest cover recorded since 1994. *Macrocystis pyrifera* stipe density was  $0.5/m^2$ . No *Eisenia arborea* or *Pterygophora californica* were observed, similar to recent years. One *Laminaria farlowii* juvenile was recorded for a density of  $0.042/m^2$ . *Cystoseira* spp. was present for a cover of 0.3%, the first observation of this species since 1984. Miscellaneous brown algae increased to 6.8%, the highest recorded since 1985. The brown algae *Colpomenia* sp. was common. Green algae decreased to a cover of 1.8%, but still similar to past years. Miscellaneous red algae cover was 4.3%. Miscellaneous plants consisting of filamentous brown diatoms had a cover of 13%. These diatoms were in several large patches mostly in low lying, soft bottom areas.

Articulated coralline algae were rare with a cover of 0.17%. Encrusting coralline algae cover was 54%, similar to recent years. Bare substrate cover was 27%.

Similar to past years, the most common miscellaneous invertebrate on RPCs was *Spirobranchus spinosus*, Christmas tree worm. Miscellaneous invertebrates *Ophiothrix spiculata* had a cover of 9.7%. *Diopatra ornata* cover was recorded at 0.17%, similar to past years. Miscellaneous bryozoans cover was 1.5%. *Corynactis californica* cover was 0.33%. *Balanophyllia elegans* and *Astrangia lajollaensis* covers were 0.50% and 0.33% respectively, similar to past years. *Lophogorgia chilensis* continue to be rare with several observed and a density of  $0.0014/m^2$ . Sponges were rare and none were observed on RPCs. *Tethya aurantia* density was  $0.031/m^2$ , similar to past years. Tunicates cover was 0.17%.

Overall, *Strongylocentrotus* spp. appeared bigger this year, especially at the west end of the transect. *Strongylocentrotus franciscanus* density was  $4.0/m^2$ , similar to the past several years. No small *S. franciscanus* were observed. *Strongylocentrotus purpuratus* continued to dominate this site with a density of  $38.5/m^2$ , similar to recent years. Several juvenile *S. purpuratus* were found near the west end. No *Centrostephanus coronatus* were observed on 1 m quadrats, but they were present at the site, similar to recent years. *Lytechinus anamesus* were rare with only one observed along the transect. One *S. purpuratus* was observed with sea urchin wasting disease on September 13<sup>th</sup>.

*Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.04/m<sup>2</sup> and 0.06/m<sup>2</sup> respectively, similar to recent years. *Patiria miniata* density remained similar to past years at 0.25/m<sup>2</sup>. No *Pycnopodia helianthoides* were observed at the site. *Parastichopus parvimensis* density was 0.33/m<sup>2</sup>, similar to recent years. Three *Patiria miniata* were observed with sea star wasting disease on September 13<sup>th</sup>.

*Aplysia californica* density was 0.015/m<sup>2</sup>, similar to past years. *Megastraea undosa* density remained low for the fifth consecutive year at 0.50/m<sup>2</sup>, with all sizes present. *Megathura crenulata* density was 0.12/m<sup>2</sup>, similar to past years. *Cypraea spadicea* density was 0.54/m<sup>2</sup>, similar to past years.

*Crassedoma giganteum* density was relatively low at 0.015/m<sup>2</sup>. *Panulirus interruptus* density was 0.007/m<sup>2</sup>, a decrease from last year, but still relatively high compared to past years. No *Kelletia kelletii* were observed on band transects and were rare at the site. *Tegula regina* were rare with only five found for size frequencies and none observed on 1 m quadrats.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Similar to recent years, fish were moderately diverse but present in low abundance. *Coryphopterus nicholsii* were the most common fish observed at this site with up to 397 observed. *Coryphopterus nicholsii* remained relatively abundant along the main transect with an increase in density to 2.7/m<sup>2</sup>. *Alloclinus holderi* density was 0.25/m<sup>2</sup> and up to nine were observed during the fish count, similar to recent years. Four *Lythrypnus dalli* were observed, but none were recorded during 1 m quadrats. *Oxylebius pictus* were moderately abundant with up to 15 observed and none observed on 1 m quadrats. *Chromis punctipinnis* were abundant with up to 205 adults and seven juveniles observed. *Oxyjulis californica* were also abundant with up to 204 adults and 176 juveniles observed, an increase from last year. Up to three female *Semicossyphus pulcher* were observed but no juveniles or males were recorded. Eight female, no juvenile and three male *Halichoeres semicinctus* were observed. Up to seven adult and one juvenile *Hypsypops rubicundus* were observed. *Paralabrax clathratus* were abundant with up to 38 adults and no juveniles observed. Up to 73 adult *Girella nigricans* were observed. *Embiotoca jacksoni* were common with up to 27 adults and seven juveniles observed. Two *Rhacochilus vacca* adults and four juveniles were observed. Up to four adult and 37 juvenile *Sebastodes atrovirens* were observed. This is the highest number of juvenile *S. atrovirens* recorded at this site. They were all located at the west end in the *Macrocystis pyrifera* plants. Two adult *Sebastodes serranoides* and three adult *Sebastodes serriceps* were observed. Up to four *Sebastodes chrysomelas*, black and yellow rockfish, were observed. Four juvenile *Sebastodes paucispinis*, bocaccio, were observed. Three KGB were observed. One *Myliobatis californica*, bat ray, was observed. One *Rhacochilus toxotes*, rubberlip surfperch, was observed. Up to 10 of *Brachyistius frenatus*, kelp surfperch, were observed. One adult *Medialuna californiensis*, halfmoon, was observed. Two *Lythrypnus zebra*, zebra goby, were observed. One juvenile and one adult *Heterostichus rostratus*, giant kelpfish, were observed. One *Artedius corallinus*, coralline sculpin,

was observed. One *Leiocottus hirundo*, lavender sculpin, was observed. One adult *Heterodontus francisci*, horn shark, was observed. One *Paralabrax nebulifer*, barred sandbass, was recorded; the second time that this species has been recorded at this site since we began roving diver fish counts. Roving diver fish counts were conducted on September 5<sup>th</sup> and October 4<sup>th</sup> by four divers observing 25 species and six divers observing 25 species, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was employed on September 18<sup>th</sup>.

All seven ARMs were monitored for all indicator species. Three of the ARMs had two layers of bricks buried in sediment and several other ARMs had ½ to 1½ layers buried, similar to past years. No *Octopus* spp. were observed in the ARMs this year. One 61 mm *Haliotis corrugata* was observed for a density of 0.14/ARM, the first observation of this species in the ARMs since 1994. No other *Haliotis* spp. were observed. *Cypraea spadicea* density remained high at 20.9/ARM. About 15% of the *C. spadicea* observed had juvenile morphology. No *Megastrea undosa* or *Megathura crenulata* were present in the ARMs. *Crassedoma giganteum* density was 3.7/ARM. One *Patiria miniata* was present at 0.14/ARM, similar to last year. *Pisaster giganteus* density was 0.71/ARM.

*Strongylocentrotus franciscanus* density was 14.4/ARM, relatively high for this site, with an average size of 49 mm. *Strongylocentrotus purpuratus* density was higher than the last several years at 79.0/ARM, the highest density recorded since 1994. Mean size for *S. purpuratus* was larger than recent years averaging 41 mm. *Parastichopus parvimensis* less than ten centimeters were abundant with 4.9/ARM and those greater than ten centimeters were 4.0/ARM, both increases from recent years and indicative of recent recruitment.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Yellow Banks, Santa Cruz Island**

**Site #10 SCYB**

**2007 sampling dates: 6/2, 6/22, 8/15.**

**2007 status: Mature kelp forest.**

This site changed little from last year, although there were more *Macrocystis pyrifera*. Overall, the kelp appeared healthy and the site was a mature forest with large, widely spaced *M. pyrifera*. Sea urchin density continued to decline, with fewer patches of *Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* observed at the site. Adult and subadult *Macrocystis pyrifera* densities increased to 0.26/m<sup>2</sup> and 0.38/m<sup>2</sup>, respectively, while juvenile density declined to 0.29/m<sup>2</sup>. Cover was 9.8% and stipe density was 3.8/ m<sup>2</sup>. No *Eisenia arborea*, *Pterygophora californica* or *Laminaria farlowii* were observed on 1 m quadrats or RPCs. However, two *P. californica* were present off the transect. A few small *Cystoseira* spp. were present and had a cover of 0.83%. Red algae cover was 7.5%, lower than last year, but still relatively high for this site. Green algae were not observed on RPCs. Miscellaneous brown algae were present at 0.17%. Miscellaneous plants, consisting of filamentous diatoms, decreased to 1.8Encrusting coralline algae cover was 42%, similar to past years. Articulated coralline algae cover decreased from last year to 3.0%, but was similar to previous years. %. Bare substrate cover increased from a record low to 24%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* decreased to 6.2%. Similar to last year, the most dominant miscellaneous invertebrates were hydroids. Miscellaneous bryozoans remained relatively abundant and increased to 16%. *Diaperoecia californica* cover was 0.83%. Sponges cover was 0.5%. *Tethya aurantia* were moderately abundant with a density of 0.09/m<sup>2</sup>. *Lophogorgia chilensis* were abundant on the offshore side of the transect with a density of 0.069/m<sup>2</sup>, similar to past years. Very small *L. chilensis* were common. *Muricea fruticosa* density was 0.006/m<sup>2</sup>, similar to last year, but relatively low for this site. *Muricea californica* were common at 0.019/m<sup>2</sup>. Tunicate cover was 3.2%, the highest recorded at this site. *Corynactis californica* cover was 0.17%. *Balanophyllia elegans* and *Astrangia lajollaensis* cover were 0.0% and 0.67%, respectively. One *Urticina lofotensis* was observed at 0.0014/m<sup>2</sup>.

*Strongylocentrotus* spp. densities remained low and there were only a few noticeable patches of sea urchins that were mainly in crevices. *Strongylocentrotus franciscanus* were relatively uncommon with a density was 0.21/m<sup>2</sup>, similar to recent years. We could only find 57 *S. franciscanus* for size frequency measurements this year with a moderate amount of search effort. *Strongylocentrotus purpuratus* density declined to 2.1/m<sup>2</sup>, but was similar to recent years. *Lytechinus anamesus* were relatively rare and mostly small, heavily covered with debris and difficult to see. Their density was 0.12/m<sup>2</sup>. No *Centrostephanus coronatus* were observed on 1 m quadrats for the fifth consecutive year. Sea urchin wasting disease was not observed.

*Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.08/m<sup>2</sup> and 0.02/m<sup>2</sup>, respectively, similar to past years. None were measured for size frequencies this year, but most appeared small. *Patiria miniata* density was the highest recorded at this site since monitoring began in 1986 at 2.2/m<sup>2</sup>, and has been gradually increasing since 1999. *Pycnopodia helianthoides*

were less abundant than last year, but still common at 0.0083/m<sup>2</sup>. A total of 24 *P. helianthoides* were found for size frequencies and almost all were greater than 200 mm. Several *Dermasterias leviuscula* were observed. *Ophiothrix spiculata* were not observed on RPCs. *Parastichopus parvimensis* and *Parastichopus californica* juveniles (less than six cm) were common, see section on ARMs below. No *Parastichopus parvimensis* were observed on 1 m quadrats.

No *Haliotis* spp. were found along the transect this year. *Megastraea undosa* density remained low at 0.04/m<sup>2</sup>, consisted mainly of larger individuals. One *Lithopoma gibberosa* was observed on size frequencies, but none were observed on 1 m quadrats. Three *Tegula regina* were found during size frequencies and a density of 0.04/m<sup>2</sup> was recorded. *Cypraea spadicea* density was 0.08/m<sup>2</sup>. *Kelletia kelletii* density was 0.05/m<sup>2</sup>. *Megathura crenulata* remained relatively rare at a density of 0.004/m<sup>2</sup>. *Crassedoma giganteum* density was 0.003/m<sup>2</sup>, similar to recent years. No *Aplysia californica* were observed.

We were able to conduct roving diver fish counts at this site twice this season. The counts are reported with the highest number recorded from the two visits. If there is a large discrepancy in the range, it is stated as such. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Fish were slightly more abundant and diverse than last year. *Coryphopterus nicholsii* were common with up to 165 observed and a density of 0.88/m<sup>2</sup>. *Alloclinus holderi* were rare with only two observed at the site, but none during sampling. *Oxylebius pictus* adults and juveniles were relatively abundant with up to 17 observed and a density of 0.17/m<sup>2</sup>. Twelve adult *Chromis punctipinnis* were observed. *Oxyjulis californica* were abundant during the June fish count with up to 240 adults and 3000 juveniles observed. There were at least five female, three juvenile and no male *Semicossyphus pulcher* observed. Up to two female, no juvenile and one male *Halichoeres semicinctus* were observed. *Paralabrax clathratus* were less common than last year with up to 10 adults observed. Five *Girella nigricans* were observed. Up to three adult and two juvenile *Embiotoca jacksoni* were observed. One *Hypsurus caryi*, rainbow surfperch, was observed. There were four adult and two juvenile *Rhacochilus vacca* observed. *Sebastes* spp. recruitment was higher than usual at this site. Up to two juvenile *Sebastes mystinus* were observed. Up to four adult and 37 juvenile *Sebastes atrovirens* were observed. One *Sebastes serranoides* juvenile was observed. Two adult and one juvenile *Sebastes serriceps* were observed. Up to four young of the year *Sebastes miniatus*, vermillion rockfish, were observed. Four adult and three juvenile *Sebastes caurinus*, copper rockfish, were observed. One adult *Sebastes chrysomelas*, black and yellow rockfish, was observed. One adult *Sebastes carnatus*, gopher rockfish, was observed. Two small adult and five juvenile *Sebastes paucispinis*, bocaccio, were observed. Up to 23 kelp/gopher/black and yellow/copper rockfish young of the year complex (KGB) were observed. Up to 113 *Brachystius frenatus*, kelp surfperch, were located in the kelp canopy. A school of up to 60 *Trachurus symmetricus*, jack mackerel, was observed. A school of up to 100 *Atherinops affinis*, topsmelt, was also observed. Fish counts were conducted on June 21<sup>st</sup> by three divers and August 15<sup>th</sup> by four divers observing 27 and 22 species, respectively.

Over the last several years this site has become a mature kelp forest and a decline in *Strongylocentrotus* spp. densities has been observed as well as a shift in their habitat preference from being out in the open to the use of crevice habitat. The ARMs function as excellent crevice habitat and as expected, we are observing much higher densities of sea urchins inside the ARMs. Due to the high number of *Strongylocentrotus* spp. in the ARMs and the bottom time required to sample at this relatively deeper site, we did not sample all ARMs for *Strongylocentrotus* spp. this year. A total of seven ARMs were monitored for all indicator species and the remaining eight ARMs were sampled for all indicator species excluding *Strongylocentrotus* spp. The presence of *Octopus* spp. was similar to last year with a total of four observed. Note that due to an observer error, all indicator species, excluding *Strongylocentrotus* spp., were not returned to ARM# 2364 after sampling was completed aboard the vessel. The collection bag was lost during replacement.

One *Haliotis corrugata* was observed in the ARMs at 29 mm. No other *Haliotis* spp. were observed. No *Tegula regina* were observed. *Cypraea spadicea* density was 8.7/ARM, similar to recent years. Two of the *C. spadicea* had egg clutches and three had juvenile morphology. Two *Kelletia kelletii* were observed in the ARMs for a density of 0.13/ARM. No *Megastraea undosa* were observed in the ARMs. *Megathura crenulata* density was to 0.67/ARM, the highest observed since we began monitoring the ARMs in 1995. *Crassedoma giganteum* density was 2.5/ARM. *Patiria miniata* density was 7.5/ARM with a mean size of 26 mm, similar to recent years. *Pisaster giganteus* decreased in abundance to 2.8/ARM with a mean size of 19 mm. Two *Pycnopodia helianthoides* were found in the ARMs for a density of 0.13/ARM. *Strongylocentrotus* spp. densities were monitored in seven of the 15 ARMs. *Strongylocentrotus franciscanus* density remained high and increased to 149/ARM, the highest density recorded since we began monitoring the ARMs in 1992. Their mean size was 26 mm, similar to last year. *Strongylocentrotus purpuratus* density remained high as well at 217/ARM, the highest recorded since 1999. Their mean size decreased slightly to 29 mm. Three *Lytechinus anamesus* were observed in the ARMs with a density of 0.2/ARM. One small (8 mm) *Centrostephanus coronatus* was observed at a density of 0.07/ARM, indicating some recruitment. *Parastichopus parvimensis* less than ten centimeters and greater than ten centimeters were observed at 1.2/ARM and 1.1/ARM, respectively, this was an increase in juveniles. Small *Parastichopus californicus* were present with three less than ten centimeters observed in the ARMs this year. *Parastichopus californicus* is not one of our indicator species, but the current staff has been keeping notes on their abundance over the past few years.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Admiral's Reef, Anacapa Island**

**Site #11 ANAR**

**2007 sampling dates: 7/13, 8/8.**

**2007 status: Dominated by *Ophiothrix spiculata* and in some areas *Strongylocentrotus purpuratus* and *S. franciscanus*.**

Overall, this site changed little from last year. Most of the transect was devoid of macroalgae, however, there were some *Macrocystis pyrifera* and *Eisenia arborea* present at the westernmost 35 meters of the transect. Overall, *M. pyrifera* was rare over much of the transect except for the western portion. Adult, subadult, and juvenile densities were 0.0/m<sup>2</sup>, 0.0/m<sup>2</sup> and 0.005/m<sup>2</sup>, respectively and none were observed on RPCs. A total of 52 adult or subadult *M. pyrifera* plants were found within the transect area for size frequency measurements and this was all of the plants within that area (100 x 20 m). *Eisenia arborea* were present on the tops of rocks, but neither juveniles nor adults were observed during sampling. No *Pterygophora californica*, *Laminaria farlowii* or *Cystoseira* spp. were observed at the site, similar to recent years. Miscellaneous red algae cover decreased to 13% and mostly consisted of *Laurencia pacifica* and filamentous red algae. *Gigartina* spp. were not observed. Green algae cover was 0.5%. Encrusting coralline algae cover was 54%, relatively high for this site. Bare substrate cover was 18%, an increase from last year, but similar to recent years.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 19%, similar to recent years. Most of this category consisted of hydroids and gorgonians. *Lophogorgia chilensis* density was 0.068/m<sup>2</sup>, similar to recent years. *Muricea fruticosa* and *Muricea californica* densities were also similar to recent years at 0.0030/m<sup>2</sup> and 0.018/m<sup>2</sup>, respectively. *Corynactis californica* were common with a cover of 1.3%, a decrease from last year, but similar to recent years. *Astrangia lajollaensis* cover remained low at 1.0%. Similarly, *Balanophyllia elegans* remained rare with none observed within the transect area, but several were observed in the ARMs. Sponges cover was 0.5%. *Tethya aurantia* density was 0.085/m<sup>2</sup>, an increase from last year and the highest density recorded since 1984. Miscellaneous bryozoans cover was 2.0%. *Diaperioecia californica* were present on the steep slopes of large rocks or reef at the west end of the transect and cover directly along the transect was 0.83%, similar to recent years. Tunicates remained relatively rare at 0.83% cover.

Sea urchin densities remained similar to last year, are still moderately high and this site would likely be dominated by them if *Ophiothrix spiculata* were not present.. *Strongylocentrotus franciscanus* density was 9.2/m<sup>2</sup> and *S. purpuratus* density was 7.5/m<sup>2</sup>, similar to recent years. No *Lytechinus anamesus* were observed at the site. *Centrostephanus coronatus* density remained relatively high at 0.5/m<sup>2</sup>. At most sites where *C. coronatus* recruitment was high during the 1997/1998 El Nino years, we have observed recent declines; however, at this site the density has remained stable over the last several years. Several *S. franciscanus* were observed with wasting disease on July 13<sup>th</sup>.

*Ophiothrix spiculata* density remained high were present over most of the transect area with a cover of 46%, similar to recent years. *Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.0/m<sup>2</sup> and 0.02/m<sup>2</sup>, respectively. They were large with a mean size of 143 mm. *Patiria miniata* remained relatively abundant for this site with a density of 2.0/m<sup>2</sup>. No *Pycnopodia helianthoides* were observed. Similar to the previous six years, *Parastichopus parvimensis* density remained low at 0.54/m<sup>2</sup>. No sea star wasting disease was observed.

No *Haliotis corrugata* or *H. rufescens* were observed at the site. No *Megastraea undosa* were observed on 1 m quadrats and only 10 were found along the transect during size frequencies with

moderate search effort, indicating they are rare. *Tegula regina* were common with a density of 0.042/m. *Crassedoma giganteum* density was 0.065/m<sup>2</sup>. *Megathura crenulata* were common at a density of 0.06/m<sup>2</sup>, with many juveniles observed in crevices. *Aplysia californica* density was 0.0097/m<sup>2</sup>. *Kelletia kelletii* density was 0.056/m<sup>2</sup>, similar to last year. No *Panulirus interruptus* were observed.

We were able to conduct roving diver fish counts twice at this site this season. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Fish were moderately abundant and diverse at this site, similar to last year. *Coryphopterus nicholsii* were abundant at 2.8/m<sup>2</sup> and up to 610 were observed on the roving diver fish count. *Alloclinus holderi* density was 0.25/m<sup>2</sup> with up to 17 observed. Up to five *Lythrypnus dalli* were observed but none were observed on 1 m quadrats. *Oxylebius pictus* were abundant with up to 50 counted and a density of 0.17/m<sup>2</sup>. Up to 24 female, 12 juvenile and no male *Semicossyphus pulcher* were observed; this is an increase in juveniles for this site. Most of the fish counters only observed three to seven female sheephead and only one observed 24 and this observer would be considered to have intermediate experience. Adult and juvenile *Chromis punctipinnis* were the most abundant fish at this site with up to 1130 and 64 observed, respectively. These were the first juvenile/young-of-the-year *C. punctipinnis* observed this season, appearing in two different size classes (2-3 cm and 3-5 cm). A few of the adult *C. punctipinnis* individuals appeared to have signs of *Vibiro damsella* bacterial infection. This is an observation that has been previously noted on *C. punctipinnis* at this site in the past. Adult *Oxyjulis californica* were common with up to 99 observed. Five female, one juvenile and four male *Halichoeres semicinctus* were observed. Up to four adult *Paralabrax clathratus* were observed. *Girella nigricans* were common with up to 22 observed. *Hypsopops rubicundus* were present with up to 10 adults observed, similar to last year. *Embiotoca jacksoni* were common with up to 13 adults and no juvenile observed. Up to six adults and no juvenile *Rhacochilus vacca* were observed. No *Embiotoca lateralis* were observed. One adult and four juvenile *Sebastodes mystinus* were observed. Up to five adult and 12 juvenile *Sebastodes atrovirens* were observed. One *Sebastodes serranoides* was observed. *Sebastodes serriceps* were common with up to 10 adults and five juveniles observed. Up to three *Sebastodes chrysomelas*, black and yellow rockfish, were observed. One *Sebastodes carnatus*, gopher rockfish, was observed. Up to 11 KGB were observed. One *Scorpaena guttata*, California scorpionfish, was observed. Up to three *Rhacochilus toxotes*, rubberlip surfperch, were observed. A single adult *Phanerodon furcatus*, white surfperch, was observed. Up to three *Hyperprosopon argenteum*, walleye surfperch, were observed. *Medialuna californiensis*, halfmoon, were present in the midwater with up to six observed. One *Caulolatilus princeps*, ocean whitefish, was observed. Up to four *Lythrypnus zebra*, zebra goby, were observed. A school of up to approximately 7,000 *Engraulis mordax*, northern anchovy, was observed. Roving diver fish counts were conducted on July 13<sup>th</sup> by five divers and on August 8<sup>th</sup> by seven divers observing 28 and 24 species, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was employed on September 13<sup>th</sup>.

All six ARMs at this site were monitored for all indicator species and three cages were replaced. One 24 mm *Haliotis corrugata* was observed in the ARMs for a density of 0.17/ARM. *Cypraea spadicea* density was 0.33/ARM, similar to recent years. *Megathura crenulata* density was 2.0/ARM, the highest density recorded here since we began monitoring in 1993. Their mean size was similar to recent years at 30 mm and indicative of a recruitment event. *Crassedoma giganteum* density was 0.5/ARM, similar to recent years, but remained low compared to densities observed in the 1990's. *Tegula regina* density was 3.0/ARM. *Patiria miniata* remained abundant but density decreased from last year to 14.5/ARM. No *Pisaster giganteus* were observed in the ARMs this year. *Lytechinus anamesus* were not observed in the ARMs. *Strongylocentrotus franciscanus* density was 13/ARM, a decrease from last year. *Strongylocentrotus purpuratus* density also decreased to 13/ARM. *Parastichopus parvimensis* density greater than ten cm and less than ten cm were 0.3/ARM and 0.5/ARM, respectively, and similar to last year. The *P. parvimensis* greater than 10 cm were relatively small and we think were around two to three years old. One *Octopus* spp. was observed.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

The original zero end eyebolt was found this year on top of a large rock about 2.5 meters inshore of the existing zero end bolt that has been there for at least 20 years. In addition several of the other original thread rods (no eyebolts left on them) at meters 40, 50, and 60 were located about 2-3 meters inshore of where the current lead line is and has been for 20 years (David Kushner) Five new eyebolts were installed this year at meters 20, 30, 40, 50, and 60 to replace missing ones.

**Location: Cathedral Cove, Anacapa Island**

**Site #12 ANCC**

**2007 sampling dates: 05/17, 7/17, 9/4.**

**2007 status: Mature kelp forest.**

Overall, this site was similar to last year, but an increase in macroalgae was observed along the transect. *Macrocystis pyrifera* canopy cover was estimated at 100%, an increase from last year. *Macrocystis pyrifera* were abundant along the entire transect and adult densities increased to 0.33/m<sup>2</sup> while subadult and juvenile densities decreased to 0.07/m<sup>2</sup> and 5.3/m<sup>2</sup>, respectively and cover decreased to 33%. *Macrocystis pyrifera* stipes density was high at 6.0/m<sup>2</sup>. Adult *Eisenia arborea* density decreased to 0.04/m<sup>2</sup> with no juveniles observed and a cover of 1.2%. *Laminaria farlowii* was notably more abundant. Adult and juvenile *L. farlowii* densities increased to 2.1/m<sup>2</sup> and 23.0/m<sup>2</sup> respectively, and cover increased to 45%. These are the highest abundances recorded at this site for this species since monitoring began in 1982. *Cystoseira* spp. were also common with a cover of 33%. Miscellaneous brown algae cover was 7.3%, similar to recent years, and consisted mostly of *Dictyota* spp. Miscellaneous red algae cover was 23%, the highest cover recorded for this category since monitoring of this site began. Green algae cover was 0.83%, similar to recent years. Miscellaneous plants cover was 1.7%. Articulated coralline algae cover was 31%. Encrusting coralline algae cover was 29%, similar to past years. Bare substrate cover was 8.3%, low for this site.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 13%, similar to last year. This category consisted mostly of the Christmas tree worm, *Spirobranchus spinosus*, and hydroids. No gorgonians were observed during band transects. Miscellaneous bryozoan cover remained high at 23%. *Diaperoecia californica* cover was 1.2%. Sponge cover was 0.33%. One *Tethya aurantia* was recorded on band transects for a density of 0.0014/m<sup>2</sup>. Tunicate cover was high at 9.5% and consisted mostly of *Pycnoclavella stanleyi* and *Metandrocarpa taylori*. *Serpulorbis squamigerus* cover was 0.83%. *Diopatra ornata* cover was similar to last year at 3.3%. *Phragmatopoma californica* were not observed on RPCs. *Corynactis californica* cover was 0.33%. *Astrangia lajollaensis* and *Balanophyllia elegans* were not observed on RPCs.

*Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* density were similar to the last several years at 3.7/m<sup>2</sup> and 1.3/m<sup>2</sup>, respectively. Individuals at this site and Landing Cove are typically larger than other sites on Anacapa Island. This year, the average size of *S. franciscanus* and *S. purpuratus* were 64 mm and 36 mm, respectively. *Centrostephanus coronatus* were not observed on 1 m quadrats. No sea urchin wasting disease was observed; however, black spot disease was observed on several *S. franciscanus* and *S. purpuratus* tests.

No *Pisaster giganteus* or *Patiria miniata* were observed on either 1 m quadrats or 5 m quadrats and were rare at the site overall, similar to previous years. They are so rare that no *P. giganteus* or *A. miniata* were located for size frequencies. *Parastichopus parvimensis* density was relatively low at 0.79/m<sup>2</sup>. No sea star wasting disease was observed at the site.

*Megastraea undosa* were moderately abundant at 2.6/m<sup>2</sup>, similar to recent years. *Crassedoma giganteum* remained common at 0.05/m<sup>2</sup>. No *Aplysia californica* were observed. *Panulirus interruptus* were moderately abundant with a density of 0.03/m<sup>2</sup>. There were some notably large *P. interruptus* observed at this site, which is located in a no-take marine reserve. *Megathura crenulata* density remained relatively high and was similar to recent years at 0.03/m<sup>2</sup>. *Cypraea spadicea* density was 0.08/m<sup>2</sup>. *Kelletia kelletii* density was 0.02/m<sup>2</sup>. *Tegula regina* were rare and none were observed during sampling.

Similar to past years, fish were abundant and diverse at this site. *Coryphopterus nicholsii* were uncommon with a density was 0.25/m<sup>2</sup> and up to nine observed. *Alloclinus holderi* density was 0.58/m<sup>2</sup> with up to seven observed. *Lythrypnus dalli* were rare with two observed, and none were observed on 1 m quadrats. *Oxylebius pictus* was also rare with only one observed on the fish count. *Chromis punctipinnis* were abundant with up to 257 adults and no juveniles observed. *Oxyjulis californica* were common with up to 19 adults and 42 juveniles observed. Up to eight female, one juvenile and one male *Semicossyphus pulcher* were observed. Up to six female, no juvenile and one male *Halichoeres semicinctus* were observed. Up to eight adult *Hypsypops rubicundus* were observed. *Paralabrax clathratus* were abundant with up to 37 adults and nine juveniles observed. *Embiotoca jacksoni* were common with up to 15 adults and nine juveniles observed. One adult and seven juvenile *Rhacochilus vacca* were observed. Up to 16 adult *Girella nigricans* were observed. Up to three adult and 138 juvenile *Sebastes atrovirens* were observed. This is a relatively high abundance for juvenile *S. atrovirens*. Thirteen adult *Sebastes serranoides* were observed. One adult *Sebastes serriceps* was observed. Up to 26 *Sebastes paucispinis*, bocaccio, juveniles were observed. Up to seven KGB were counted. One *Rhacochilus toxotes*, rubberlip surfperch, was observed. Two adult *Medialuna californiensis*, halfmoon, were observed. *Brachystius frenatus*, kelp surfperch, were abundant and 98 were observed. Up to six juvenile and one adult *Heterostichus rostratus*, giant kelpfish, were observed. Roving diver fish counts were conducted on September 4<sup>th</sup> by four divers observing 24 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 4<sup>th</sup>.

All seven ARMs were monitored for all indicator species. One *Octopus* spp. was found in the ARMs this year. Four *Haliotis corrugata* were observed for a density of 0.57/ARM, an increase from recent years. Their sizes ranged from 16 mm to 44 mm. No other *Haliotis* spp were observed. *Cypraea spadicea* density remained high at 18.6/ARM. *Megastraea undosa* density was 1.3/ARM, similar to past years. *Crassedoma giganteum* density was 4.1/ARM. *Kelletia kelletii* density was 0.86/ARM. *Megathura crenulata* density was 0.29/ARM. One *Tegula regina* was found for a density of 0.14/ARM. *Patiria miniata* density remained high at 9.9/ARM. *Pisaster giganteus* density was 3.6/ARM. *Strongylocentrotus franciscanus* density decreased to 65.7/ARM and *S. purpuratus* density also decreased to 96.0/ARM. We estimated that less than 2 % of the *S. purpuratus* were observed with black spot disease in the ARMs. *Centrostephanus coronatus* were observed at 0.43/ARM, similar to last year, and were small indicating recent recruitment. *Parastichopus*

*parvimensis* density notably increased in the ARMs this year, similar to observations made at other sites this year. Individuals less than ten centimeters and greater than ten centimeters were observed with densities of 7.0/ARM and 1.1/ARM, respectively. This high number of small *P. parvimensis* indicates a recent recruitment event.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Landing Cove, Anacapa Island**

**Site #13 ANLC**

**2007 sampling dates: 6/20, 8/6.**

**2007 status: Mature kelp forest.**

This site continues to be a very lush, diverse kelp forest with large fish and invertebrate species who find refuge within the boundaries of the marine reserve. It is important to note that this site was sampled much earlier in the season than usual and upon the second visit, there was noticeably less macroalgae present, which is often common later in the season. All density data was collected during the June visit. Canopy cover of *Macrocystis pyrifera* was estimated at 50%, similar to past years. The canopy was thickest at the northern end of the transect, above the shallow reef, where large, mature plants were common. Along the southern portion of the transect, the cobble floor had juvenile and subadult plants present. However, adult *M. pyrifera* plants rarely mature here as the cobble is too small to keep the plants from floating away as they mature. In addition to the unsuitable habitat, the southern end is subject to heavy boat traffic and high amounts of propeller wash may also be a factor for the larger *M. pyrifera* individuals to survive.

Adult, subadult and juvenile *Macrocystis pyrifera* densities were 0.07/m<sup>2</sup>, 0.21/m<sup>2</sup>, and 10.5/m<sup>2</sup>, respectively, and cover was 26%, all somewhat similar to past years. *Macrocystis pyrifera* stipe density was 2.1/m<sup>2</sup>. Juvenile *Eisenia arborea*, *Pterygophora californica* and *Laminaria farlowii* were all abundant at this site. Adult and juvenile *E. arborea* densities were 1.4/m<sup>2</sup> and 2.4/m<sup>2</sup>, respectively, the highest densities recorded for this species since they were added to 1 m quadrats in 1996. Cover of *E. arborea* was similar to past years at 30%. *Pterygophora californica* remained relatively abundant with adult and juvenile densities of 0.67/m<sup>2</sup> and 1.8/m<sup>2</sup>, respectively. Cover for *P. californica* was 17%, the highest on record for this site. *Laminaria farlowii* remained at high densities with adults and juveniles at 5.6/m<sup>2</sup> and 42/m<sup>2</sup>, respectively, also the highest juvenile density recorded since they were added to 1 m quadrats in 1996. *Laminaria farlowii* cover was the highest recorded at this site at 52%. *Cystoseira* spp. was common with a cover of 6.5%, also high for this site. Miscellaneous brown algae were common at a cover of 6.5%. Similar to previous years, there was a high abundance of red algae cover along the shallow reef and *Plocamium* spp. was noticeably more abundant than usual. Miscellaneous red algae cover increased to 45%, the highest recorded since monitoring began in 1982. *Gelidium* spp. cover was 23% and was only present along the shallow reef. *Gigartina* spp. cover was 0.67%, similar to past years. Green algae cover was 2.2%. Miscellaneous plant cover, consisting mostly of filamentous diatoms, was 0.33% similar to past years. Articulated coralline algae cover was 19%, similar to previous years. Encrusting coralline algae cover was 25%, the lowest recorded since monitoring began in 1982. Bare substrate cover was 5.7%, relatively low for this site.

Miscellaneous Invertebrates excl. *Ophiothrix spiculata*, decreased to 8.2%, relatively low for this site. The most common invertebrates in this category were amphipod tube mats. Sponge cover was 2.8%, similar to past years. *Tethya aurantia* were rare at 0.0097/m<sup>2</sup>. Miscellaneous bryozoans were common at 17%, a decrease from last year's record high but similar to previous years. *Diaperoecia californica* cover was 3.3%, similar to past years. *Diopatra ornata* cover was 0.33%. No *Phragmatopoma californica* were observed on RPCs. Tunicate cover was 4.0%, similar to past years. Overall, gorgonians were

rare or absent, similar to past years. *Lophogorgia chilensis* was the only species present, with a density of 0.0097/m<sup>2</sup>. *Corynactis californica* cover was 1.8%, similar to past years. *Astrangia lajollaensis* cover was notably low at 0.0%, the lowest recorded since 1982. *Balanophyllia elegans* were also not observed on RPCs, similar to past years.

*Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* densities were similar to recent years at 3.5/m<sup>2</sup> and 2.1/m<sup>2</sup>, respectively. Juvenile *S. franciscanus* and *S. purpuratus* were common under the spine canopy of large *S. franciscanus*. This site is one of the original reserves on the island (the other being Cathedral Cove) and these sites tend to have larger *S. franciscanus* and *S. purpuratus* than sites outside the marine reserve. Their average test diameters were 77 mm and 36 mm, respectively. *Centrostephanus coronatus* were common, though none were observed on 1 m quadrats. No *Lytechinus anamesus* were observed at the site, similar to past years. Large, dead *S. franciscanus* were common, similar to what has been observed in recent years. No sea urchin wasting disease was observed.

*Patiria miniata* were rare as usual at this site with a density of 0.0 m<sup>2</sup>, similar to past years though they are common in the ARMs. *Pisaster giganteus* were common along the steep walls, but none were observed in 1 m quadrats. *Lancair columbia*, the fragile star, were relatively common. *Parastichopus parvimensis* density was 0.67/m<sup>2</sup>, similar to past years. No sea stars were observed with wasting disease.

*Haliotis corrugata* remained rare with none were observed on band transects. Two adult *H. corrugata* were found at the site measuring 158 mm and 178 mm. These two are possibly the same individuals that have been recorded over the past several years. The abalone that has been observed for at least the last seven years on the small rock at about meter 36 along the transect and inshore between the transect and the ARMs was not observed this year.

Fish were abundant and diverse at this site, similar to past years. *Coryphopterus nicholsii* continued to decline and were rare with none were observed during 1 m quadrats for the second consecutive year; however, they were still present with up to 10 observed. *Alloclinus holderi* density was relatively low at 0.17/m<sup>2</sup>, and up to 14 observed. *Lythrypnus dalli* were not observed on 1 m quadrats but up to 18 were observed during the fish count. Up to six *Oxylebius pictus* were observed and a density of 0.08/m<sup>2</sup> was recorded. Up to 410 adult *Chromis punctipinnis* were observed, the most abundant fish at this site. Up to 204 adult *Oxyjulis californica* were observed. *Semicossyphus pulcher* were common with up to seven females, three juvenile and two males observed. *Halichoeres semicinctus* were common with up to six females, four juveniles and three males observed. *Paralabrax clathratus* were common with up to 14 adults observed. *Hypsypops rubicundus* were moderately abundant with up to 15 adults observed. Up to 22 adult *Girella nigricans* were observed. Up to 28 adults and one juvenile *Embiotoca jacksoni* were observed. Two *Embiotoca lateralis* were observed. One *Rhacochilus vacca* was observed. Up to four adult *Sebastes atrovirens* were observed. Up to eight adult and one juvenile *Sebastes serriceps* were observed. One *Sebastes chrysomelas*, black and yellow rockfish, was observed. One *Scorpaena guttata*, California scorpion fish, was

observed. One *Leiocottus hirundo*, lavender sculpin, was recorded. One *Scorpaenichthys marmoratus*, cabezon, was observed. Up to three *Lythrypnus zebra*, zebra goby, were observed. One *Gymnothorax mordax*, California moray, was observed. Roving diver fish counts were conducted on June 20<sup>th</sup> by three divers observing 23 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 19<sup>th</sup>.

All seven ARMs were sampled for all indicator species. One ARMs (#2372) cage was replaced. Two *Haliotis corrugata* were observed in the ARMs, the same as last year, for a density of 0.29/ARM and they measured 50 mm and 72 mm. *Cypraea spadicea* were less abundant this year and many with juvenile morphology were observed. Their density was 5.6/ARM, similar to past years. *Megastrea undosa* density was 1.7/ARM, higher than last year. *Tegula regina* density was 0.14/ARM. *Kelletia kelletii* density decreased from last year's record high to 0.14/ARM. *Megathura crenulata* density was relatively high at 0.71/ARM. *Crassedoma giganteum* density was 4.3/ARM, similar to last year. *Patiria miniata* density increased to 5.6/ARM with a mean size of 17 mm, similar to last year. *Pisaster giganteus* density was 0.71/ARM, and mean size of 23 mm was recorded, a decrease from last year. No *Pycnopodia helianthoides* were observed in the ARMs. *Strongylocentrotus franciscanus* density remained high at 80.6/ARM and mean size was 38 mm. *Strongylocentrotus purpuratus* density also remained high but decreased to 176.6/ARM with an increase in mean size to 26 mm. Five *S. purpuratus* in the ARMs appeared to have wasting disease, but these observations were not confirmed. One 6 mm *Centrostephanus coronatus* was observed in the ARMs for a density of 0.14/ARM. *Parastichopus parvimensis* less than ten centimeters decreased in density from last year's record high to 2.4/ARM and *P. parvimensis* greater than ten centimeters decreased to 1.3/ARM. One *Octopus spp.* was observed. In addition, several pychonogonids (sea spiders) were found in the ARMs along with a brachiopod and a Humboldt squid beak. These later two observations are rare.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: South East Sea Lion, Santa Barbara Island**

**Site #14 SBSESL**

**2007 sampling dates: 5/23.**

**2007 status: Dominated by *Ophiothrix spiculata* and *Strongylocentrotus franciscanus*.**

This site was similar to recent years and continues to be nearly devoid of macroalgae and dominated by *Ophiothrix spiculata* and *Strongylocentrotus franciscanus*. One subadult *Macrocystis pyrifera* was observed attached to a *Muricea californica* (a common observation at this site) and another on the top of a rock. No macroalgae were observed on 1 m quadrats, similar to the last several years. No *Eisenia arborea*, *Pterygophora californica*, *Laminaria farlowii*, *Cystoseira spp.* or *Desmarestia spp.* were present. Green algae cover was 0.83%, similar to last year. Miscellaneous brown algae were not observed on RPCs. Miscellaneous red algae cover was 11.7%, similar to past year. Miscellaneous plants, mostly consisting of filamentous diatoms, were common at 5.8% cover and were present mostly on the southwest end of the transect line. Articulated coralline algae remained rare with none observed on RPCs. Encrusting coralline algae dominated the rocky substrate with a cover of 78%, the highest on record at this site. Bare substrate cover remained the same at 15%.

The most common Miscellaneous Invertebrates excl. *Ophiothrix spiculata*, were hydroids and *Chaetopterus spp.*, this category cover was 5.0%, similar to recent years. *Corynactis californica* cover was 1.5%. *Astrangia lajollaensis* and *Balanophyllia elegans* continued to have low cover at 0.5% and 0.0%, respectively. Miscellaneous bryozoan cover increased slightly to 2.5%. *Diaperoecia californica* was not observed on RPCs. Sponge cover was 0.5%. *Tethya aurantia* remain abundant with a density of 0.11/m<sup>2</sup>. Tunicate cover was 0.33%. *Lophogorgia chilensis* remained moderately abundant with a density of 0.15/m<sup>2</sup>. *Muricea californica* were common with a density of 0.05/m<sup>2</sup>. *Muricea fruticosa* were rare with a density of 0.0042/m<sup>2</sup>.

*Strongylocentrotus purpuratus* density remained low for the third year at 3.2/m<sup>2</sup>. *Strongylocentrotus franciscanus* remained abundant for this site for the fourth year 10.9/m<sup>2</sup>. *Lytechinus anamesus* were common in the sandy areas and recorded on both 1 m quadrats and band transects with densities of 0.08/m<sup>2</sup> and 0.02/m<sup>2</sup>, respectively. Most *L. anamesus* were small in size (10-14 mm), similar to those observed at other sites around the island this year. *Centrostephanus coronatus* were common with a density of 0.38/m<sup>2</sup>. There was no sign of urchin wasting disease during the May sampling.

*Ophiothrix spiculata* continue to dominate this site with a cover of 51.2%, the highest cover recorded since we began monitoring this species separately in 2003. *Patiria miniata* density was 0.29/m<sup>2</sup>, a decrease from last year. Most *A. miniata* were notably large. *Pisaster giganteus* abundance was similar to last year and was counted on 1 m quadrats and 5 m quadrats with densities of 0.17/m<sup>2</sup> and 0.04/m<sup>2</sup>, respectively. No *Pycnopodia helianthoides* were observed. *Parastichopus parvimensis* density was low at 0.25/m<sup>2</sup>, similar to recent years. No sea star wasting disease was observed.

*Megastrea undosa* continued its gradual decline in abundance and was 0.13/m<sup>2</sup>, the lowest recorded since 1983. However, they were still common at the site with all sizes present, but their mean size has gradually increased to 60 mm, the highest since 1989 indicating. *Tegula regina* were abundant

and mostly large with a density of 0.33/m<sup>2</sup>. Small and medium *L. undosa* were common on the northern end of the reef where *Tegula regina* were rare. *Megathura crenulata* density was 0.02/m<sup>2</sup>, and all sizes were present. Several *Bursa californica* were observed while sampling. This species was once common the Santa Barbara Island until the late 1990's, but since that time, their presence has been rare and they have recently been more common. No *Kelletia kelletii* were observed. *Aplysia californica* density increased slightly to 0.05/m<sup>2</sup>. *Crassedoma giganteum* remain rare with a density of 0.0097/m<sup>2</sup>. *Cypraea spadicea* density was 0.042/m<sup>2</sup>.

Overall, fish diversity and abundance were low at this site similar to past years and the other Santa Barbara Island sites. *Coryphopterus nicholsii* were the most abundant fish with up to 54 observed and a density of 0.38/m<sup>2</sup>. Up to five *Oxylebius pictus* were observed, but none on 1 m quadrats. *Alloclinus holderi* continued to be rare with none observed on quadrats for the second consecutive year. Only one was observed during the fish count, but two small ones were observed afterwards. Up to 15 adult and no *Chromis punctipinnis* were observed. No *Oxyjulis californicus* were observed. One female, no male and up to three juvenile *Semicossyphus pulcher* were observed. No *Halichoeres semicinctus* were observed. Up to four adult *Hypsypops rubicundus* were observed, similar to last year. Up to seven juvenile *Sebastodes miniatus*, vermillion rockfish, were observed. Five *Sebastes chrysomelas*, black and yellow rockfish, were observed. One adult *Scorpaena guttata*, California scorpionfish, were observed. One *Artedius corallinus*, coralline sculpin, was observed. Up to two *Caulolatilus princeps*, ocean whitefish, were observed. Roving diver fish counts were conducted on May 23<sup>rd</sup> with four divers observing 11 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on June 12<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Arch Point, Santa Barbara Island**

**Site #15 SBAP**

**2007 sampling dates: 5/22.**

**2007 status: Site dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

Similar to last year, this site was mostly devoid of macroalgae. No *Macrocystis pyrifera*, *Laminaria farlowii*, *Pterygophora californica*, *Eisenia arborea* *Desmarestia* spp. and *Cystoseira* spp. were present at the site. *Sargassum muticum* was noted near the southwest end of the transect near the 90 m mark, similar to recent years. Miscellaneous brown algae cover was 0.17%, similar to past years. Miscellaneous red algae cover increased to 24% cover, the highest recorded since 2001. *Laurencia pacifica* was less abundant than recent years. Green algae cover was 0.83%. Miscellaneous plants cover, consisting mostly of filamentous diatoms, was 7.7%. Articulated coralline algae cover was similar to last year at 0.5%. Encrusting coralline algae cover increased to 77% and bare substrate cover decreased to 13%.

The most common Miscellaneous invertebrates excluding *Ophiothrix spiculata* were *Spirobranchus spinosus*, hydroids and *Balanus* spp. and this category cover was 14.5%. *Corynactis californica* cover was 2.3%, similar to recent years. *Astrangia lajollaensis* cover was 1.2%, also similar to recent years. Tunicates cover remained low with none observed on RPCs. Miscellaneous bryozoans cover was 0.67%. *Diaperoecia californica* were not observed on RPCs. *Lophogorgia chilensis* and *Muricea californica* densities were 0.0040/m<sup>2</sup> and 0.0014/m<sup>2</sup>, respectively and similar to past years.

*Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus* densities remained high. *Strongylocentrotus franciscanus* density continued its gradual decline for the third consecutive year to 14/m<sup>2</sup>. *Strongylocentrotus purpuratus* density was similar to last year at 82/m<sup>2</sup>. There was a notable increase in *S. purpuratus* juveniles, while juvenile *S. franciscanus* recruits were rare. Very small *Lytechinus anamesus* were common and their density was 0.036/m<sup>2</sup>. *Centrostephanus coronatus* density was 0.08/m<sup>2</sup>. Wasting disease was present, and estimated in at less than 1% of both *S. purpuratus* and *S. franciscanus* during the May 22<sup>nd</sup> visit.

*Pisaster giganteus* density on 1 m quadrats and 5 m quadrats was 0.042/m<sup>2</sup> and 0.035/m<sup>2</sup>, respectively. *Patiria miniata* density decreased to 0.29/m<sup>2</sup>. No *Pycnopodia helianthoides* were observed. No *Ophiothrix spiculata* were observed on RPCs, similar to past years. *Parastichopus parvimensis* density remained low at 0.13/m<sup>2</sup>. No sea star wasting disease was observed.

*Cypraea spadicea* were rare at 0.04/m<sup>2</sup>, similar to past years. *Megastraea undosa* density was 0.08/m<sup>2</sup>, the lowest on record. Large *Megastraea undosa* were relatively rare along the transect and small individuals were present in patches. Several large *Lithopoma gibberosa* were observed, but none on 1 m quadrats. *Tegula regina* were abundant with a density of 0.21/m<sup>2</sup>, similar to last year. *Aplysia californica* were common with a density of 0.089/m<sup>2</sup>, similar to recent years. *Crassedoma giganteum* density was low at 0.097/m<sup>2</sup>. One small fresh *Haliotis cracherodii* shell was observed. No *Megathura crenulata* were observed on band transects. At least five *Panulirus interruptus* were

observed on the site and several were at least legal size, their density was 0.056/m<sup>2</sup>, similar to recent years. Three *Loxorhynchus grandis* were observed along the transect.

Fish abundance and diversity declined from recent years. *Coryphopterus nicholsii* density was 0.083/m<sup>2</sup> and up to 52 were observed. No *Alloclinus holderi* were observed during the fish count, but were present with a density of 0.083/m<sup>2</sup>. Recent *A. holderi* recruits were observed after the fish counts were conducted. *Oxylebius pictus* were rare with up to four observed but none on 1 m quadrats. The most abundant fish was *Chromis punctipinnis* with up to 154 adults and no juveniles observed. *Oxyjulis californica* were rare with up to nine adults observed. Up to six female *Semicossyphus pulcher* were observed but no males or juveniles. No *Halichoeres semicinctus* were observed. Adult *Hypsypops rubicundus* were abundant with up to 47 observed. Two tagged *H. rubicundus* were observed along the transect. *Paralabrax clathratus* were rare with up to two adults observed. Up to eight adult *Girella nigricans* were observed. No *Embiotoca* spp. were observed, similar to recent years. No *Sebastodes serriceps* were observed this year. Up to three *Sebastes rastrelliger*, grass rockfish, were observed. Up to two adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. Two *Scorpaenichthys marmoratus*, cabezon, were observed. One *Artedius corallinus*, coralline sculpin, and two *Orthopias triacis*, snubnose sculpin, were observed. One school of 18 *Medialuna californiensis*, halfmoon, were observed in the midwater. One *Gymnothorax mordax*, California moray, was observed. Roving diver fish counts were conducted on May 22<sup>nd</sup> with four divers observing 15 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on June 11<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within specifications of each other.

**Location: Cat Canyon, Santa Barbara Island**

**Site #16 SBCAT**

**2007 sampling dates: 5/25, 6/5.**

**2007 status: Site dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

This site is similar to nearby sites on Santa Barbara Island and has not changed significantly over the past several years. It continues to have low diversity with very little macroalgae and is dominated by *Strongylocentrotus spp.* No macroalgae were observed on 1 m quadrats or 5 m quadrats, similar to last year. *Macrocystis pyrifera*, *Eisenia arborea*, *Pterygophora californica*, *Laminaria farlowii*, *Cystoseira spp.* and *Desmarestia spp.* were not observed along the transect. Miscellaneous brown algae were not observed on RPCs. Green algae cover was 0.5%. Miscellaneous red algae cover was 1.8% and mainly consisted of *Laurencia pacifica* and filamentous red algae. Miscellaneous plants, consisting filamentous diatoms, cover was 4.7%. Encrusting coralline algae remained abundant with a cover of 67%, similar to the other urchin dominated sites. Articulated coralline algae were not observed on RPCs. Bare substrate cover was 21%.

The most common Miscellaneous invertebrates excluding *Ophiothrix spiculata* were *Spirobranchus spinosus*, the Christmas tree worm, and hydroids and this category cover was 6.7%. Tunicate abundance remained low at 0.67% and sponges cover was 0.17%. Miscellaneous bryozoan cover was 0.83%. Similar to past years, *Diaperoecia californica* were rare and none were observed on RPCs. No *Tethya aurantia* were observed on band transects. *Astrangia lajollaensis* cover was 0.83%. *Balanophyllia elegans* were rare with a cover of 0.17%. *Corynactis californica* were also rare at 0.17% cover.

*Strongylocentrotus spp.* continued to dominate this site as they have for several years.

*Strongylocentrotus purpuratus* density remained similar to the past three years at 40/m<sup>2</sup> with a mean size of 24 mm. *Strongylocentrotus franciscanus* density was similar to last year at 10/m<sup>2</sup> and mean size was 30 mm. Juveniles of both were both common. *Lytechinus anamesus* density was 0.029/m<sup>2</sup>. *Centrostephanus coronatus* density remained low at 0.042/m<sup>2</sup>, similar to past years. There were at least three *L. anamesus* and two *S. franciscanus* observed with urchin wasting disease on May 25<sup>th</sup>.

*Pisaster giganteus* were counted on both 1 m quadrats and 5 m quadrats with densities of 0.083/m<sup>2</sup> and 0.06/m<sup>2</sup>, respectively, similar to previous years. *Patiria miniata* density was 0.083/m<sup>2</sup>.

*Parastichopus parvimensis* density was 0.46/m<sup>2</sup>, similar to recent years. No *Ophiothrix spiculata* were observed on RPCs. No sea star wasting disease was observed.

No *Haliotis spp.* were observed at the site. *Megastrea undosa* density increased and there were noticeably more small individuals on the transect. *Megastrea undosa* density was 0.79/m<sup>2</sup>, the highest since 2001. *Tegula regina* were not observed on 1 m quadrats but were moderately abundant at the site with 56 found for size frequencies. *Cypraea spadicea* were rare at 0.042/m<sup>2</sup>. *Megathura crenulata* were rare at 0.0042/m<sup>2</sup>, and only one was found for size frequencies. *Aplysia californica* density increased to 0.15/m<sup>2</sup> with smaller individuals being abundant. *Crassidoma giganteum*

density remained low at 0.0097/m<sup>2</sup>. Two *Panulirus interruptus* were observed on band transects for a density of 0.0028/m<sup>2</sup>.

Similar to past years, fish abundance and diversity were low at this site. *Coryphopterus nicholsii* density was 0.21/m<sup>2</sup> and up to 51 were recorded during the fish count. *Alloclinus holderi* were rare at a density of 0.042/m<sup>2</sup> and up to three observed. No *Lythrypnus dalli* were observed this year. *Oxylebius pictus* were rare with up to three observed on the fish count and none on 1 m quadrats. *Chromis punctipinnis* were the most abundant fish again this year with up to 108 adults and no juveniles observed. *Oxyjulis californica* were not observed during the fish count. Two female and two juvenile *Semicossyphus pulcher* were observed, but no males. No *Halichoeres semicinctus* were observed. Up to 12 adult and no juvenile *Hypsypops rubicundus* were observed. One adult *Paralabrax clathratus* was observed. Up to seven adult *Girella nigricans* were observed. One juvenile *Sebastes mystinus* was observed. No *Embiotoca jacksoni* were observed. No *Sebastes serriceps* or *Sebastes atrovirens* were observed. One adult *Sebastes rastrelliger*, grass rockfish, was observed, similar to past years. *Medialuna californiensis*, halfmoon, were common with up to 27 observed. One *Orthopias triacus*, snubnose sculpin, and one *Artedius corallinus*, coralline sculpin, were observed. One *Gymnothorax mordax*, California moray eel, was observed. Two *Neoclinus stephensae*, yellowfin fringehead, were also observed. Roving diver fish counts were conducted on May 25<sup>th</sup> by five divers observing 17 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on June 12<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Miracle Mile, San Miguel Island**

**Site #21 SMMM**

**2007 sampling dates: 7/12, 10/12.**

**2007 status: Mature kelp forest.**

Miracle Mile is not one of the original kelp forest monitoring sites. This site was set up by Jim Marshall, a commercial abalone and sea urchin fisherman, in conjunction with the County of Santa Barbara, and with the assistance of CINP. The monitoring site was chosen specifically to look at a *Haliothis rufescens* population. The site was specifically selected for its high density of *H. rufescens*. Miracle Mile is now monitored in accordance with the kelp forest monitoring program protocols for all indicator species if time and weather permits.

This site appeared similar to last year and continued to be a healthy, mature *Macrocystis pyrifera* forest with a dense and diverse understory of algae. The kelp canopy cover over the transect was estimated at 90%, and the *M. pyrifera* was healthy. Adult, subadult and juvenile *M. pyrifera* densities were similar to last year at  $0.16/m^2$ ,  $0.16/m^2$  and  $1.1/m^2$ , respectively and cover was 16%. Stipe density was  $3.0/m^2$ . *Eisenia arborea* were abundant on the tops of rocks and in the deeper areas of the transect with densities of  $0.71/m^2$  for adults,  $0.63/m^2$  for juveniles, and a cover of 28%. Adult and juvenile *Pterygophora californica* were common with densities of  $0.46/m^2$  and  $1.5/m^2$ , respectively, and a cover of 14%. *Cystoseira* spp. were common at the site but not directly along the transect with cover of 0.0%. No *Laminaria farlowii* was observed at the site. No *Desmarestia* spp. was observed on RPCs. Miscellaneous brown algae cover was 2.2%, similar to recent years. No green algae were observed on RPCs. *Gelidium* spp. cover was  $0.67/m^2$ . *Gigartina* spp. cover was 3.3%, similar to past years. Miscellaneous red algae were abundant all along the transect with a cover of 71% and consisted mostly of *Callophyllis* spp. and *Cryptopleura* spp. Articulated coralline was abundant with a cover of 33%. Encrusting g coralline algae cover was 41%. Bare substrate cover was 8.3%, similar to past years.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 18%. This category consisted mostly of hydroids and barnacles, *Balanus* spp. *Phragmatopoma californica* was not observed on RPCs this year. *Serpulorbis squamigerus* cover was 0.33%. Miscellaneous bryozoan cover was high and increased to 23%. Sponge cover remained high and was 8.8%. *Tethya aurantia* remained abundant with a density of  $0.20/m^2$ . Tunicate cover also remained high at 17%. *Styela montereyensis* were not observed on 1 m quadrats this year. *Urticina lofotensis* remain abundant with a density of  $0.21/m^2$ . *Corynactis californica* cover was 0.33%, same as last year. *Balanophyllia elegans* cover was 1.2%. *Astrangia lajollaensis* were not observed on RPCs. *Diopatra ornata* cover was 1.3%.

*Strongylocentrotus* spp. densities were similar to past years. *Strongylocentrotus franciscanus* density was  $4.0/m^2$  and all sizes were observed during size frequencies. *Strongylocentrotus purpuratus* remain relatively rare at  $0.25/m^2$ . With a moderate amount of search effort, we could only find 40 *S. purpuratus* for size frequencies. No sea urchin wasting disease was observed.

*Pisaster giganteus* were abundant and counted on 1 m quadrats and 5 m quadrats with densities of 0.67/m<sup>2</sup> and 0.24/m<sup>2</sup>, respectively. *Patiria miniata* density was similar to last year at 2.6/m<sup>2</sup>. *Pycnopodia helianthoides* density was 0.039/m<sup>2</sup>, the same as last year. We did not have time to measure these for size frequencies, but all sizes were present. *Parastichopus parvimensis* density was 0.083/m<sup>2</sup>. No sea star wasting disease was observed.

*Haliothis rufescens* were most abundant offshore of the eastern end of the transect where it is deeper. Due to the high density of *H. rufescens* we counted them on band transects and 1 m quadrats with densities of 0.67/m<sup>2</sup> and 0.38/m<sup>2</sup>, respectively. There were several smaller sized (~60 mm) *H. rufescens* in crevices, but most observed were larger emergent adults. Fresh *H. rufescens* shells that appeared to be predated on by *Cancer* spp. were common. A total of 125 *H. rufescens* were measured for size frequencies with a mean size of 175 mm, the same mean size as last year. There were 31 fresh *H. rufescens* shells found at the site, indicating some recent mortality. One adult *H. rufescens* with an estimated size of ~180 mm was observed with withering foot disease and was collected and sent to the California Department of Fish and Game.

*Kelletia kelletii* density remained relatively high for this site similar to recent years at 0.038/m<sup>2</sup>. The density of *Megathura crenulata* was the same as last year at 0.029/m<sup>2</sup>, and notably low compared to the first four years we monitored this site. *Crassedoma crenulata* were rare with a density of 0.0083/m<sup>2</sup>. *Lithopoma gibberosa* density was 0.21/m<sup>2</sup>, similar to last year and no *L. undosa* were observed. *Cancer productus* and *C. antennarius* were common and 12 were observed during band transects. *Cryptochiton stelleri*, gumboot chiton, were common and four were observed during band transects for a density of 0.0055/m<sup>2</sup>.

Roving diver fish counts were not conducted at this site this year due to time constraints. However indicator fish species were recorded on 1 m quadrats. *Coryphopterus nicholsii* density was 0.04/m<sup>2</sup> and *Oxylebius pictus* density was also 0.04/m<sup>2</sup>.

All seven ARMs were monitored for all indicator species. The cages were in good condition and a few ARMs (#2473 and #2474) had sand covering the bottom layer of bricks. There were no *Phragmatopoma californica* observed on the cages this year, they were present in past years. A total of 10 *Haliothis rufescens* were observed in the ARMs for a density of 1.4/ARM, similar to last year. The mean size continued to increase from last year to 108 mm. *Crassedoma giganteum* density was 0.3/ARM. *Kelletia kelletii* density was also 0.3/ARM. *Lithopoma gibberosa* density was 0.14/ARM. *Patiria miniata* density was 10.0/ARM, similar to last year, with a mean size of 35 mm. *Pisaster giganteus* was observed at a density of 0.9/ARM with a mean size of 62 mm. *Pycnopodia helianthoides* density was 0.9/ARM, higher than past years and most were small with a mean size of 72 mm. *Strongylocentrotus franciscanus* density was similar to last year at 4.7/ARM and mean size increased to 78 mm. *Strongylocentrotus purpuratus* density remained low and was 0.6/ARM with a mean of 31 mm. There was one *Parastichopus parvimensis* greater than ten centimeters observed for a density of 0.14/ARM.

There is no temperature unit installed at this site.

**Location: Cluster Point, Santa Rosa Island**

**Site #22 SRCP**

**2007 sampling dates: 8/23, 9/27.**

**2007 status: Developing kelp forest.**

This site continues to be a mature kelp forest with a thick canopy of *Macrocystis pyrifera*. Juvenile macroalgae were abundant. During the August sampling event, an estimated 40% of the *Macrocystis pyrifera* plants appeared to have been cut about 25 cm above the holdfast. The holdfasts were relatively intact and those that had at least one stipe greater than one meter high were measured for size frequencies, otherwise they were considered dead though the large holdfasts still seemed potentially viable. The cause of this observation is unclear.

*Macrocystis pyrifera* cover on the bottom was 7.5%, lower than last year but similar to the year before. Adult, subadult and juvenile densities were 0.29/m<sup>2</sup>, 0.03/m<sup>2</sup> and 20/m<sup>2</sup>, respectively. Stipe density was 1.7/m<sup>2</sup>. *Eisenia arborea* adults were not observed on 1 m quadrats, juvenile density was 0.04/m<sup>2</sup> and cover was 0.5%. *Pterygophora californica* adults and juvenile densities were 1.4/m<sup>2</sup> and 4.6/m<sup>2</sup>, respectively and had a cover of 9.7%, all similar to last year. No adult *Laminaria farlowii* adults were observed, and juvenile density remained low at 0.21/m<sup>2</sup>. Green algae cover was 0.17%, the same as last year. Miscellaneous red algae were abundant again this year at 53% cover and included *Microcladia* spp., *Cryptopleura* spp., *Chondracanthus* spp. and *Rhodymenia* spp. Miscellaneous brown algae cover was 0.83%. *Desmarestia* spp. cover was 2.2%. *Gigartina* spp. cover was similar to last year at 1.8%. Articulated and encrusting coralline algae covers were 2.5% and 16%, respectively. Bare substrate cover was 14%, similar to last year.

Miscellaneous invertebrate excluding *Ophiothrix spiculata* cover increased to 22%. The most common species in this category were hydroids including *Aglaophenia* spp. and *Obelia* spp., but others were also common. Tunicate cover remained high at 8.5%. *Styela montereyensis* density was 0.46/m<sup>2</sup>. Sponges were moderately abundant with a cover of 4.8% and included a moderate amount of *Hymenamphiastra cyanocrypta*, similar to last year. *Tethya aurantia* remained abundant with a density of 0.35/m<sup>2</sup> and most were large. Bryozoans cover was 6.2% and no *Diaperoecia californica* was observed on RPCs. *Diopatra ornata* were present in the sand channels that run through the site with 1.8% cover. *Phragmatopoma californica* cover was 3.7%. Sea anemones were common with *Corynactis californicus* cover at 0.83% and *Urticina lofotensis* density at 0.096/m<sup>2</sup>. *Balanophyllia elegans* and *Astrangia lajollaensis* covers were 1.8% and 0.67%, respectively. *Lophogorgia chilensis*, *Muricea californica* and *Muricea fruticosa* were not observed at this site, same as last year.

Sea urchin densities remained low though they have gradually increased since we began monitoring the site in 2005. They were mostly confined to the cracks and crevices and not out in the open. *Strongylocentrotus franciscanus* density was 2.3/m<sup>2</sup> and mean size of 70 mm with very few juveniles observed. *Strongylocentrotus purpuratus* density was 1.3/m<sup>2</sup>. With a moderate search effort only 73 could be found for size frequencies with a mean size of 35 mm.. No sea urchin wasting disease was observed.

Sea stars were moderately abundant throughout the site, similar to previous years. *Pisaster giganteus* densities on 1 m quadrats and 5 m quadrats were 0.11/m<sup>2</sup> and 0.21/m<sup>2</sup>, respectively. *Patiria miniata* were observed at all sizes with a density of 2.6/m<sup>2</sup>. *Pycnopodia helianthoides* were rare at 0.03/m<sup>2</sup>. *Parastichopus parvimensis* density was 0.17/m<sup>2</sup>. No sea star wasting disease was observed.

*Haliothis rufescens* were rare at a density of 0.003/m<sup>2</sup> with only one measured at 83 mm and a few others noted (but not measured) on the tops of rocks. One fresh *H. rufescens* shell was found and measured at 68 mm. *Cypraea spadicea* density was similar to last year at 0.21/m<sup>2</sup>. No *Megastrea undosa* was observed. *Lithopoma gibberosa* density was 0.04/m<sup>2</sup>. *Megathura crenulata* density was 0.029/m<sup>2</sup>, similar to recent years. *Kelletia kelletii* density was relatively low at 0.017/m<sup>2</sup>. *Crassedoma giganteum* were common with a density of 0.043/m<sup>2</sup>, and most were large. No *Aplysia californica* were observed on band transects. One large *Panulirus interruptus* with a carapace length of 92 mm was observed, but was not present on band transects.

Fish at this site were moderately diverse, similar to last year, but less abundant. *Coryphopterus nicholsii* were rare with up to eight observed during the roving diver fish count and none on 1 m quadrats, similar to last year. No *Alloclinus holderi* were observed. *Oxylebius pictus* density was 0.21/m<sup>2</sup> and up to eight were observed. *Chromis punctipinnis* were uncommon with eight adults and no juveniles observed. *Oxyjulis californicus* were one of the more abundant fish at this site with up to 24 adults observed. No *Halichoeres semicinctus* were observed. *Semicossyphus pulcher* were common with up to four females, no juveniles and six males observed. No *Paralabrax clathratus* were observed. One *Girella nigricans* was observed. Up to five adult and one juvenile *Embiotoca jacksoni* were observed. Up to five adult and no juvenile *Embiotoca lateralis* were observed. Up to three *Rhacochilus vacca* adults were observed. The most abundant fish at this site was *Sebastodes mystinus* with up to 29 adults and no juveniles observed. Up to eight adult and no juvenile *Sebastodes atrovirens* were observed. Up to three *Sebastodes serranoides* were observed. No *Sebastodes serriceps* were observed. One *Sebastodes melanops*, black rockfish, was observed in the midwater. Three large adult *Sebastodes miniatus*, vermillion rockfish, were observed. One KGB was observed. One *Rhacochilus toxotes*, rubberlip surfperch, and one *Brachystistius frenatus*, kelp surfperch, were observed. Roving diver fish counts were conducted on August 23<sup>rd</sup> by two divers observing 18 species.

During the August visit to this site, an estimated 40% of the *Macrocystis pyrifera* plants appeared to have been cut about 25 cm above the holdfast. Similar observations were made in September during our visit to Bee Rock on Santa Rosa Island (not a KFM site) where a very large area (many thousands of square meters) had evidence of this phenomenon. The holdfasts were relatively healthy looking indicating the “cuts” had occurred somewhat recently. Inquiries were made with local fisherman who all agreed that similar observations had been made in previous years. Due to the large area that was affected, we think this was most likely a result of a physical or biological perturbation and not due to any human activity such as active cutting by a diver. However, the cause of these observations is still unclear.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 27<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Trancion Canyon, Santa Rosa Island**

**Site #23 SRTC**

**2007 sampling dates: 8/21.**

**2007 status: Mature kelp forest.**

This site was similar to last year and remained a mature kelp forest. *Macrocystis pyrifera* canopy cover was estimated at 55%, and appeared thinner than past years. There was an abundance of understory algae, similar to most of our sites on this island. *Macrocystis pyrifera* adults, subadult and juvenile densities were 0.31/m<sup>2</sup>, 0.21/m<sup>2</sup> and 3.7/m<sup>2</sup>, respectively, and cover was 18%, all similar or higher than last year. Stipe density was 4.5/ m<sup>2</sup>. *Pterygophora californica* cover increased 7.5% and adult and juvenile densities were 0.38/m<sup>2</sup> and 0.79/m<sup>2</sup>, respectively; and again all similar or higher than recent years. *Laminaria farlowii* were present at the site, but none were observed during sampling. *Eisenia arborea* were moderately abundant off the transect with an adult density of 0.042/m<sup>2</sup>, no juveniles, and a cover of 0.33%. Miscellaneous red algae were abundant at 47%. Miscellaneous brown algae were rare with a cover of 0.17%. *Gigartina* spp. were moderately abundant at a 4.7% cover. Articulated coralline algae were common at 7.8% and encrusting coralline algae cover was 15%. Bare substrate was 16%, similar to recent years.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* were abundant with a cover of 23% and this category consisted mostly of hydroids. Tunicates were abundant with a 12% cover. *Styela montereyensis* density was 0.71/m<sup>2</sup>, similar to past years. *Tethya aurantia* were abundant at 0.22/m<sup>2</sup> and were mostly large. Sponges were common with a cover of 3.7%. *Corynactis californica*, *Balanophyllia elegans*, and *Astrangia lajollaensis* covers were 0.83%, 0.67%, and 0.50%, respectively. *Urticina lofotensis* density was 0.067/m<sup>2</sup>. *Diaperoecia californica* cover was 1.0%. *Diopatra ornata* were present in patches and were most abundant on the west end of the transect with a cover of 9.0%. *Phragmatopoma californica* cover was 3.0%, similar to past years.

Sea urchins were relatively abundant and mostly large at this site with very few juveniles observed. *Strongylocentrotus franciscanus* density was 5.8/m<sup>2</sup>, similar to the past two years. *Strongylocentrotus purpuratus* density was 4.2/m<sup>2</sup>, higher than the past two years. No *Lytechinus anamesus* or *Centrostephanus coronatus* were observed. No sea urchin wasting disease was observed.

*Pisaster giganteus* were counted on both 1 m quadrats and 5 m quadrats with densities of 0.25/m<sup>2</sup> and 0.24/m<sup>2</sup>, respectively. Both large and small *Patiria miniata* were common with a density of 2.1/m<sup>2</sup>. *Pycnopodia helianthoides* density decreased to 0.008/m<sup>2</sup>. *Parastichopus parvimensis* density was 0.17/m<sup>2</sup>. No sea star wasting disease was observed..

*Haliotis rufescens* density was 0.0014/m<sup>2</sup>, and a total of two adult and two juveniles were found at the site, but only two were measured for size frequencies. *Cypraea spadicea* density was 0.33/m<sup>2</sup>. No *Lithopoma gibberosa* was observed on 1 m quadrats and *L. undosa* were rare at 0.04/m<sup>2</sup>. *Kelletia kelletii* were rare with a density of 0.007/m<sup>2</sup>. *Megathura crenulata* were common on the large rocks and boulders with a density of 0.04/m<sup>2</sup>. *Crassedoma giganteum* density was relatively high at

0.05/m<sup>2</sup>, but only one was measured for size frequencies due to lack of time. One *Cryptochiton stelleri*, gumboot chiton, was observed at the site.

Fish continue to be abundant and diverse at this site, similar to most of our sites on this island. *Coryphopterus nicholsii* were common at 0.25/m<sup>2</sup> and up to 18 were observed on the roving diver fish count. Both adult and juvenile *Oxylebius pictus* were observed with a density of 0.08/m<sup>2</sup> and up to 16 observed. Juvenile *O. pictus* were notably abundant this year along the transect. The most commonly observed species was *Chromis punctipinnis* with up to 77 adults and no juveniles. *Oxyjulis californicus* were not observed this year. Up to seven female, three male and no juvenile *Semicossyphus pulcher* were observed. Similar to last year, the *S. pulcher* males were notably large. No *Halichoeres semicinctus* were observed. There were up to 10 adult and one juvenile *Embiotoca jacksoni* observed. Up to eight adult and one juvenile *Rhacochilus vacca* were observed. *Embiotoca lateralis* were moderately abundant with up to 21 adults and five juveniles observed. One adult *Paralabrax clathratus* was observed. *Sebastodes mystinus* were very abundant with up to 57 adults and two juveniles observed. *Sebastes atrovirens* were also abundant with up to 22 adults and three juveniles observed. Up to seven adult *Sebastes serranoides* were observed. One adult and one juvenile *Sebastes serriceps* were observed. Up to six adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. Thirteen adult *Sebastes melanops*, black rockfish, were observed. Up to four KGB were observed. One adult *Scorpaenichthys marmoratus*, cabezon, was observed. Six *Rhacochilus toxotes*, rubberlip surfperch, were observed. Eight *Brachystius frenatus*, kelp surfperch, were observed. A school of about 70 *Atherinops affinis*, topsmelt, was observed. The roving diver fish count was conducted on August 21<sup>st</sup> with four divers observing 24 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 24<sup>th</sup> and October 9<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Chickasaw, Santa Rosa Island**

**Site #24 SRCSAW**

**2007 sampling dates: 8/22.**

**2007 status: Mature kelp forest.**

Similar to previous years, this site remains a healthy mature kelp forest. The kelp canopy cover was estimated at 50% and was thinner than last year allowing for better light conditions to support a dense understory of algae. *Macrocystis pyrifera* adults, subadults and juvenile densities were 0.53/m<sup>2</sup>, 0.35/m<sup>2</sup>, and 2.8/m<sup>2</sup>, respectively, and cover was high at 43%. All of these abundances are relatively high or the high or the highest recorded for this site since we began monitoring in 2005. *Eisenia arborea*, density was 0.0/m<sup>2</sup>, and cover was 0.83%. *Pterygophora californica* adult and juvenile densities were 0.08/m<sup>2</sup> and 0.79/m<sup>2</sup>, respectively, and had a cover of 0.5%. Juvenile *Laminaria farlowii* density was 1.1/m<sup>2</sup>, but no adults were observed on 1 meter quadrats and none were observed on RPCs, similar to past years. *Cystoseira* spp. cover was 0.5%. No *Desmarestia* spp. was observed on RPCs. Green and miscellaneous brown algae covers were 0.17% and 1.8%, respectively. Red algae cover remained high at 67%, respectively. The most common red algae was *Rhodymenia* spp. *Gigartina* spp. cover was 2.7%. Both articulated coralline algae and encrusting coralline algae cover increased this year to 14% and 28%, respectively. Bare substrate cover decreased to 5.8%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* were less abundant at this site than last year with a cover of 7.3%. The most commonly observed invertebrates in this category were hydroids. Bryozoan cover increased to 38%. No *Diaperoecia californica* was observed on RPCs. *Diopatra ornata* was abundant along the transect in the sand channels with a cover of 17%. *Serpulorbis squamigerus* cover was 0.33%. Tunicate cover remained relatively abundant at 12% and included a diverse group of species including *Cystodytes lobatus*, *Polyclinum planum* and *Didemnum cernulentum*. *Styela montereyensis* density was 0.21/m<sup>2</sup>, with both large and small ones observed. Sponge cover was 2.3%. *Tethya aurantia* were mostly large at this site with a density of 0.11/m<sup>2</sup>. *Corynactis californica* cover was similar to last year at 0.33%. *Urticina lofotensis* density was 0.07/m<sup>2</sup>. *Balanophyllia elegans* and *Astrangia lajollaensis* cover were 1.7% and 0.5%, respectively. Gorgonians were rare, similar to most of our sites on the south side of Santa Rosa, with no *Lophogorgia chilensis*, *Muricea californica* or *Muricea fruticosa* observed.

Sea urchins remained at low densities and were mostly observed in the crevices of large rocks and boulders. *Strongylocentrotus franciscanus* density was low at 1.3/m<sup>2</sup>, but higher than the past two years. Most of the *S. franciscanus* were large with a mean size of 85 mm, but juveniles were common under their spine canopy. *Strongylocentrotus purpuratus* were rare with a density of 0.17/m<sup>2</sup>, and only 111 could be found for size frequency measurements with a moderate amount of search effort. This is more than that were found the past two years. Most of these were packed tightly into cracks or under the spine canopy of large *S. franciscanus* individuals. No sea urchin wasting disease was observed.

*Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.17/m<sup>2</sup> and 0.29/m<sup>2</sup>, respectively. *Patiria miniata* were common with a density of 1.6/m<sup>2</sup>. *Pycnopodia helianthoides* were rare and mostly small in size with a density of 0.006/m<sup>2</sup> and mean size of 117 mm. We were only able to find 15 for size frequency measurements, notably less than the past two years. *Parastichopus parvimensis* remained rare this year with a density of 0.04/m<sup>2</sup>, and were large.

*Haliotis rufescens* density was 0.017/m<sup>2</sup>, similar to last year. There were 37 *H. rufescens* found for size frequencies with a mean of 188 mm and most individuals were greater than 195 mm.

*Megastrea undosa* and *Lithopoma gibberosa* were not observed. *Cypraea spadicea* density was 0.42/m<sup>2</sup>. *Megathura crenulata* were rare with a density of 0.003/m<sup>2</sup>, and only four found for size frequencies. *Crassedoma giganteum* density was 0.014/m<sup>2</sup>.

Similar to last year, fish at this site were diverse and moderately abundant. *Coryphopterus nicholsii* density was 0.25/m<sup>2</sup> and up to 10 were observed on the roving diver fish count. *Oxylebius pictus* were abundant at 0.5/m<sup>2</sup> and up to 26 observed during the fish count. Adult *Chromis punctipinnis* were rare with only two adults observed. No *Oxyjulis californica* were present during the fish count, unlike last year. Three female, three male and no juvenile *Semicossyphus pulcher* were observed. Up to seven adults and two juvenile *Embiotoca jacksoni* were observed. Five adult *Rhacochilus vacca* were observed, but no juveniles. *Embiotoca lateralis* were common with up to nine adults and four juveniles observed. Up to 26 adults and three juvenile *Sebastes mystinus* were observed. Up to 18 adult and 12 juvenile *Sebastes atrovirens* were observed. *Sebastes serranoides* were relatively common with up to 14 adults and one juvenile observed. No *Sebastes serriceps* were observed. Up to six *Sebastes chrysomelas*, black and yellow rockfish, were observed. One adult and one juvenile *Sebastes carnatus*, gopher rockfish, were observed. Up to four kelp/gopher/black and yellow/copper rockfish young of the year complex (KGB) were observed in the canopy. One *Ophiodon elongatus*, lingcod, and one *Hexagrammus decagrammus*, kelp greenling, were observed. This is one of the few sites where we often observe kelp greenlings. *Brachystius frenatus*, kelp surfperch, were in the canopy with up to nine observed. Two adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. A school of up to 100 *Atherinops affinis*, topsmelt, were observed. One adult *Scorpaenichthys marmoratus*, cabezon, was observed. One juvenile *Cebidichthys violaceus*, monkeyface prickleback, was observed after the fish count and was thus not recorded in the database. Roving diver fish count was conducted on August 22<sup>nd</sup> by three divers observing 26 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 20<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: South Point, Santa Rosa Island**

**Site #25 SRSP**

**2007 sampling dates: 7/26.**

**2007 status: Mature kelp forest.**

This site was similar to last year with slightly more *Macrocystis pyrifera* canopy cover. The canopy cover appeared thicker and was estimated at 75-80%. *Macrocystis pyrifera* adult and juvenile densities were both similar to last year at 0.34/m<sup>2</sup> and 2.1/m<sup>2</sup>, respectively. Subadult density and cover declined and were 0.03/m<sup>2</sup> and 17%, respectively. *Eisenia arborea* were present at the site, but none were observed on 1 m quadrats. *Eisenia arborea* cover was 0.5%, similar to last year.

*Pterygophora californica* adults and juveniles were moderately abundant with densities of 0.92/m<sup>2</sup> and 0.38/m<sup>2</sup>, respectively, and a cover of 9.7%. *Laminaria farlowii* was common were adult and juvenile densities of 0.29/m<sup>2</sup> and 0.17/m<sup>2</sup>, respectively, and a cover of 3.7%, all similar to recent years. No *Desmarestia* spp. were observed on RPCs. *Cystoseira* spp. cover was 3.3%. Miscellaneous red algae were abundant throughout the site with a cover of 42% and included *Polyneura* spp., *Microcladia* spp. and *Rhodymenia* spp. Miscellaneous brown algae were present in low abundance at 0.17%. *Gigartina* spp. cover was 1.8%. Articulated and encrusting coralline algae were less abundant this year with covers of 15% and 5.7%, respectively. Bare substrate cover was 12.0%.

Overall, invertebrate abundance was low relative to recent years. Miscellaneous invertebrates excluding *Ophiothrix spiculata* decreased dramatically from last year to 5.5%. This category consisted mainly of the hydroid *Aglaophenia struthionides*. Sponge cover decreased as well to 4.3%. *Tethya aurantia* density was 0.11/m<sup>2</sup>, similar to last year. Tunicate cover remained high at 11.8%. *Styela montereyensis* was with a density of 0.83/m<sup>2</sup>, similar to last year. Miscellaneous bryozoan cover was high at 17% and no *Diaperoecia californica* were observed on RPCs. *Diopatra ornata* cover was much higher than previous years at 17%. *Phragmatopoma californica* was common in the *Macrocystis pyrifera* holdfasts and cover was 4.3%. *Dodecaceria fewkesi* was relatively common along the transect. *Urticina lofotensis* density was 0.025/m<sup>2</sup>. No *Corynactis californica*, *Astrangia lajollaensis* or *Balanophyllia elegans* were observed on RPCs. Similar to recent years, no *Lophogorgia chilensis*, *Muricea californica* and *Muricea fruticosa* were observed.

*Strongylocentrotus franciscanus* density remained low at 0.083/m<sup>2</sup>. There were noticeably more *S. purpuratus* and density increased to 1.4/m<sup>2</sup>. No *Lytechinus anamesus* or *Centrostephanus coronatus* were observed. All urchins were confined to the crevice habitat, which is limited directly along the transect line at this site. Both large and small *S. franciscanus* were present with a mean size of 73 mm. *Strongylocentrotus purpuratus* were mostly small with a mean size of 29 mm and found under the spine canopy of *S. franciscanus*. No sea urchin wasting disease was observed.

*Pisaster giganteus* counted on 1 m quadrats and 5 m quadrats with a densities of 0.0/m<sup>2</sup> and 0.055/m<sup>2</sup>, respectively. *Patiria miniata* were relatively common along the transect with a density of 2.8/m<sup>2</sup>, and mean size of 62 mm, similar to recent years. *Pycnopodia helianthoides* were rare at a density of 0.0028/m<sup>2</sup> and four were found for size frequencies with a mean size of 121 mm. No sea star wasting disease was observed.

*Haliotis rufescens* were common at the site with a density of 0.05/m<sup>2</sup>, similar to last year and 90 measured were measured with a mean size of 177 mm. We measured abalone while conducting band transects and look between those transect to cover the entire site. This year we found the same number of abalone as last year, and we think this is a good proxy of abundance at the site. *Cypraea spadicea* density was 0.13/m<sup>2</sup>. *Lithopoma gibberosa* and *Megastraea undosa* were not observed on 1 m quadrats this year. However, five large *L. undosum* were found along the transect for size frequencies with a mean size of 125 mm. *Megathura crenulata* were rare at 0.0042/m<sup>2</sup>. *Crassedoma giganteum* were not observed on band transects, but we found eight for size frequency measurements. *Kelletia kelletii* density was 0.0056/m<sup>2</sup>.

Fish at this site increased in abundance and diversity from last year, with several more species recorded during the roving diver fish count. *Coryphopterus nicholsii* were more common this year at 0.13/m<sup>2</sup> and up to 34 were observed on the fish count. *Oxylebius pictus* were also common with a density of 0.38/m<sup>2</sup> and up to 26 observed. *Alloclinus holderi* were not observed. *Chromis punctipinnis* were relatively abundant for this site with 43 adults and no juveniles observed. *Oxyjulis californica* were also abundant with up to 57 adults and no juveniles recorded. Nine female, one juvenile and four male *Semicossyphus pulcher* were observed. No *Halichoeres semicinctus* were observed. No *Hypsypops rubicundus* were observed. *Paralabrax clathratus* were rare with up to four adults and no juveniles counted. *Girella nigricans* were present with up to three adults observed. *Embiotoca jacksoni* were moderately abundant with up to 17 adults and five juveniles observed. *Embiotoca lateralis* were common with up to nine adults and four juveniles recorded. Up to three adult *Rhacochilus vacca* were observed. Ten adult and one juvenile *Sebastodes mystinus* were observed. Thirty-nine adult and five juvenile *Sebastodes atrovirens* were observed, many more than recorded last year. Twelve adult and one juvenile *Sebastodes serranoides* were observed, same as last year. Two juvenile *Sebastodes serriceps* were observed. Three adult, *Sebastodes carnatus*, gopher rockfish, were observed. Up to 10 *Sebastodes chrysomelas*, black and yellow rockfish, were counted. There were up to eight KGB young of year complex observed. One *Scorpaenichthys marmoratus*, cabezon, was observed. There were a few sculpins observed including one *Artedius corallinus*, coralline sculpin, two *Orthopias triacis*, snubnose sculpin and one *Leiocottus hirundo*, lavender sculpin. Up to two adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. *Brachystistius frenatus*, kelp surfperch, were present in the kelp canopy with up to two observed. Two adult and one juvenile *Hypsurus caryi*, rainbow surfperch, were observed. There were up to 21 juvenile *Heterostichus rostratus*, giant kelpfish, observed. Two *Citharichthys stigmaeus*, speckled sanddab, were observed. Small schools of *Atherinops affinis*, topsmelt, and *Aulorhynchus flavidus*, tubesnout, were observed with up to 50 and 36 recorded, respectively. One *Myliobatis californica*, bat ray, was observed. Roving diver fish count was conducted on July 26<sup>th</sup> by six divers observing 31 species of fish.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 20<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Devil's Peak Member, Santa Cruz Island**

**Site #26 SCDPM**

**2007 sampling dates: 8/24, 9/10.**

**2007 status: Dominated by *Strongylocentrotus purpuratus*.**

The site continued to be dominated by *Strongylocentrotus purpuratus* and had very little macroalgae. Most macroalgae present at the site were located on the tops of large boulders. No *Macrocystis pyrifera* was observed within the transect area, although there were some located southwest of the transect area. Adult and juvenile *Eisenia arborea* were present on top of rocks but none were observed on 1 m quadrats or RPCs. No *Pterygophora californica*, *Laminaria farlowii*, or *Desmarestia* spp. were observed. One *Cystoseira* spp. was observed at the site, but not on RPCs. No brown algae were recorded on RPCs, but there were patches of *Dictyota/Pachydictyon* spp. present near the sand channels on the offshore side. Miscellaneous red algae were common at 21% cover, an increase from last year, and consisted mostly of *Rhodymenia* spp. Green algae cover was 0.17%. Miscellaneous plant cover was higher than last year at 26% and consisted of filamentous diatoms. It is common to observe large fluctuations of this category. Encrusting coralline algae cover was 52%, similar to past years. Articulate coralline algae were rare with a 0.33% cover. Bare substrate cover was 6.7%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover increased to 26%. The most common miscellaneous invertebrates on RPCs were *Spirobranchus spinosus* and hydroids. *Diopatra ornata* were common in the low lying areas with sand, but were rare along the main transect with a cover of 0.17%. Sponge cover was 0.5%. *Tethya aurantia* density was 0.021/m<sup>2</sup>. Tunicates cover was relatively high for this site at 4.8%. *Pycnoclavella stanleyi* and *Aplidium productum* were the most common in this category. *Corynactis californica* cover was 0.5%. *Astrangia lajollaensis* and *Balanophyllia elegans* covers were 3.5% and 0.17%, respectively. *Lophogorgia chilensis* was abundant with a density of 0.23/m<sup>2</sup>, an increase from last year. Large *Muricea californica* were common and several *M. fruticosa* were observed with densities of 0.0056/m<sup>2</sup> and 0.0014/m<sup>2</sup>, respectively. Miscellaneous bryozoans cover was 8.0%. The parchment tube worm, *Chaetopterus variopedatus* were abundant on top of rocks on the eastern half of the transect and were observed simultaneously spawning. The spawning event noticeably decreased visibility in the water column.

*Strongylocentrotus purpuratus* dominated this site with a density of 21/m<sup>2</sup>, similar to last year. *Strongylocentrotus franciscanus* were common with a density of 3.2/m<sup>2</sup>, similar to last year but continued to gradually increase since we began monitoring in 2005. *Centrostephanus coronatus* were moderately abundant in the crevice habitat, but had a relatively low density on 1 m quadrats at 0.13/m<sup>2</sup>, similar to last year. *Lytechinus anamesus* were common with a density of 0.04/m<sup>2</sup> on band transects. We were able to find 88 for size frequency measurements. An estimated 10% of *L. anamesus* had wasting disease and this disease was observed in any other urchin species.

*Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.33/m<sup>2</sup> and 0.15/m<sup>2</sup>, respectively. Most *P. giganteus* were medium-sized with a mean of 99 mm. *Patiria miniata* were common with a density of 0.58/m<sup>2</sup>, and some juveniles were observed. *Pycnopodia*

*helianthoides* density was 0.0069/m<sup>2</sup>, and we observed one actively feeding on *Pachythylene rubra*. *Pachythylene rubra* cover was relatively abundant and similar to last year at 14%. *Parastichopus parvimensis* density was 0.25/m<sup>2</sup>. No sea star wasting disease was observed.

*Megathura crenulata* were abundant with a density of 0.35/m<sup>2</sup>, an increase from last year. *Kelletia kelletii* were rare at a density of 0.0028/m<sup>2</sup>, and only three found at the site. *Megastraea undosa* were relatively abundant compared to other nearby sites this year and large with a density of 0.17/m<sup>2</sup>. *Tegula regina* were present at the site, but not observed on 1 m quadrats. *Crassedoma giganteum* were abundant common at 0.11/m<sup>2</sup>, with all sizes present. Some large *C. giganteum* appeared to have been harvested from the site by divers, due to the top half of the shell being removed. *Aplysia californica* density was 0.025/m<sup>2</sup> and some were observed mating.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Similar to last year, this site had high diversity and abundance of fish. *Coryphopterus nicholsii* were abundant with a density of 1.4/m<sup>2</sup> and up to 236 observed on the roving diver fish count. *Alloclinus holderi* were also more abundant than last year with a density of 0.63/m<sup>2</sup> and up to 42 observed. *Lythrypnus dalli* density was 0.13/m<sup>2</sup> and up to 19 observed. Up to 21 *Oxylebius pictus* were observed, but none on 1 m quadrats. Up to 173 *Oxyjulis californica* adults and four juveniles were observed. *Chromis punctipinnis* was the most abundant fish with up to 409 adults and 30 juveniles observed. Five female, two juvenile and one male *Semicossyphus pulcher* were observed. Nine female, five juvenile and seven male *Halichoeres semicinctus* were observed. *Hypsypops rubicundus* were abundant with up to 23 adults observed. Up to 24 adult and one juvenile *Paralabrax clathratus* were observed. Up to five adult *Girella nigricans* were observed. *Embiotoca jacksoni* were moderately abundant with up to 23 adults and one juvenile observed. Two adult *Embiotoca lateralis* were observed. Up to six adult and one juvenile *Rhacochilus vacca* were observed. *Sebastes* spp. were present, but fewer species were observed as last year. Two adult *Sebastes mystinus* were observed. Eight adult *Sebastes atrovirens* were observed. One adult *Sebastes serranoides* was observed. Up to four adult and three juvenile *Sebastes serriceps* was observed. One KGB young of the year complex was counted. Five *Sebastes carnatus*, gopher rockfish, and one *Sebastes caurinus*, copper rockfish, were observed. One *Ornothopias triacis*, snubnose sculpin, was observed. One *Artedius corallinus*, coralline sculpin, was observed. One adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. Up to six adult *Medialuna californiensis*, halfmoon, were observed. One *Gymnothorax mordax*, California moray eel, was observed. Four *Lythrypnus zebra*, zebra goby, were observed. Roving diver fish counts were conducted on August 24<sup>th</sup> and September 10<sup>th</sup> with five divers each count observing 21 and 23 species of fish, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on August 27<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Potato Pasture, Santa Cruz Island**

**Site #27 SCPP**

**2007 sampling dates: 8/9, 9/18, 9/28.**

**2007 status: Site dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

Overall, there was little noticeable change since last year. This site remained dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus* and was almost entirely devoid of macroalgae except on tops of rocks at this high relief site. No *Macrocystis pyrifera*, *Eisenia arborea*, *Pterygophora californica*, *Laminaria farlowii*, *Cystoseira* spp. or *Desmarestia* spp. were observed at the site. Miscellaneous brown algae were rare and none were observed on RPCs. Most notable in this category was the *Colpomenia* spp. on tops of rocks. Miscellaneous red algae cover was 11%, a decrease from recent years. No green algae was observed on RPCs. Miscellaneous plants comprised of filamentous diatoms cover was 2.2%. Encrusting coralline algae cover was 42%, similar to last year. Articulated coralline algae were rare with a cover of 0.30%. Bare substrate cover was 18%, similar to last year.

Encrusting invertebrates were abundant in the high relief areas. Miscellaneous invertebrate excluding *Ophiothrix spiculata* was lower than last year at 14%. The most dominant miscellaneous invertebrate was *Clavularia* spp., which has also been common at other sites nearby. Sponges were present but were not observed on RPCs. *Tethya aurantia* were common at a density of 0.065/m<sup>2</sup>. Miscellaneous bryozoans cover was 2.0%, similar to other nearby sites. *Diaperocenia californica* was common on the sides of rocks mostly off the main transect where RPCs are conducted with a cover of 0.5%. Tunicates were rare with a cover of 0.33%, similar to last year. *Corynactis californica* were common with a cover of 2.8%. *Astrangia lajollaensis* were common with a cover of 2.3%. *Balanophyllia elegans* cover was 0.33%, and mostly in the low lying areas. *Lophogorgia chilensis* was abundant in the low lying areas in small patches at a density of 0.17/m<sup>2</sup> and all sizes were common, similar to last year. *Muricea californica* and *M. fruticosa* were not observed on band transects.

*Strongylocentrotus* spp. continued to dominate the site and densities were similar to last year. *Strongylocentrotus purpuratus* density was 26/m<sup>2</sup>. *Strongylocentrotus franciscanus* were moderately abundant at 7.3/m<sup>2</sup>. *Lytechinus anamesus* were also moderately abundant in the low lying areas and were recorded at a density of 0.71/m<sup>2</sup>. *Lytechinus anamesus* were present mostly at the east end of the transect within the first 20 m. This part of the transect is low lying compared to the rest of the transect. Some juvenile *Strongylocentrotus* spp. were noted. *Centrostephanus coronatus* adults were present out in the open, but not recorded during sampling. We estimated 1-3% of *Strongylocentrotus* spp. and *L. anamesus* had wasting disease during this August visit.

*Pisaster giganteus* density on 1 m quadrats and 5 m quadrats were 0.042/m<sup>2</sup> and 0.055/m<sup>2</sup>, respectively. *Patiria miniata* were common at a density of 0.38/m<sup>2</sup>, similar to last year. *Pachythylene rubra* were abundant along the first 30 meters of the transect covering more area than last year at 4.3%. *Parastichopus parvimensis* were moderately abundant at a density of 0.67/m<sup>2</sup>, similar to last year. One *Pycnopodia helianthoides* was observed for a density of 0.0014/m<sup>2</sup>, and this was the only

one observed at the site. *Henricia* spp. and *Pisaster ochraceus* were observed at the site. No sea star wasting disease was observed.

No *Haliotis* spp. were observed at the site. *Crassedoma giganteum* were abundant at 0.15/m<sup>2</sup> and large ones were notably common, similar to last year. *Megathura crenulata* were abundant with a density of 0.10/m<sup>2</sup>. *Megastraea undosa* increased in density to 0.29/m<sup>2</sup>. A total of 62 were measured and most were small with a mean size of 32 mm. *Tegula regina* decreased in density to 0.04/m<sup>2</sup> and only 28 were found for size frequencies with a mean size of 50 mm. *Kelletia kelletii* density was 0.025/m<sup>2</sup>, similar to last year. *Aplysia californica* density was 0.013/m<sup>2</sup>, similar to last year. *Panulirus interruptus* density was 0.0028/m<sup>2</sup>.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Fish were moderately abundant and diverse at this site. Similar to last year, *Coryphopterus nicholsii* were very abundant in their preferred rock/sand habitat at a density of 1.8/m<sup>2</sup> and up to 560 were observed during the roving diver fish count. *Alloclinus holderi* density was 0.25/m<sup>2</sup> with up to 18 observed. Up to 53 *Lythrypnus dalli* were observed, but none were observed on 1 m quadrats. *Oxylebius pictus* density was 0.04/m<sup>2</sup> and up to 24 individuals observed. *Chromis punctipinnis* was the most abundant fish with up to 500 adults and 30 juveniles observed. Up to 75 adult, but no juvenile *Oxyjulis californica* were observed. Eight female, one juvenile and one male *Semicossyphus pulcher* were observed. *Halichoeres semicinctus* were common with up to 18 females, one juvenile and four males observed. *Hypsopops rubicundus* were abundant with up to 22 adults observed, similar to last year. *Paralabrax clathratus* were also abundant with 29 adults observed. Five adult *Girella nigricans* were observed. Up to 12 adult, but no juvenile *Embiotoca jacksoni* were observed. *Rhacochilus vacca* were common with up to 14 adults and no juveniles observed. Three adult, but no juvenile *Sebastes mystinus* were observed. No *Sebastes atrovirens* were observed. Four adult *Sebastes serranoides* were observed. Four adult and four juvenile *Sebastes serriceps* were observed. Two adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. Five *Sebastes carnatus*, gopher rockfish, were observed. Up to three *Sebastes caurinus*, copper rockfish, were observed. One *Sebastes auriculatus*, brown rockfish, was observed. Up to three KGB complex were observed. Two *Scorpaenichthys marmoratus*, cabezon, were observed. One *Scorpaena guttata*, California scorpion fish, was observed. One *Ornithopias triacis*, snubnose sculpin, was observed. *Rhacochilus toxotes*, rubberlip surfperch, were common with up seven adults observed. Two *Phanerodon furcatus*, white surfperch, were observed. Eleven *Medialuna californiensis*, halfmoon, were observed. Two *Caulolatilus princeps*, ocean whitefish, were observed. Up to three *Lythrypnus zebra*, zebra goby, were observed. One *Myliobatis californicus*, bat ray, was observed. Roving diver fish counts were conducted on September 18<sup>th</sup> and 28<sup>th</sup> by five divers each observing 27 and 29 species, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on October 10<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Cavern Point, Santa Cruz Island**

**Site #28 SCCVP**

**2007 sampling dates: 6/19, 9/19.**

**2007 status: Dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

Similar to last year, algae were low in abundance and diversity. No adult and only several juvenile *Macrocystis pyrifera* was but none on 1 m quadrats or RPCs. No adult and some juvenile *Eisenia arborea* observed, but none on RPCs and only one juvenile on 1 m quadrats for a density of 0.042/m<sup>2</sup>. No *Laminaria farlowii*, *Pterygophora californica* or *Cystoseira* spp. were observed. Some *Desmarestia* spp. were observed, but none on RPCs. *Codium setchellii* was common on top of rocks, and green algae cover was 0.017%, similar to last year. Red algae at the site consisted mostly of *Laurencia pacifica* and *Rhodymenia* spp. which were both common. Miscellaneous red algae cover was 7.8%, a large decrease from last year. Miscellaneous plants, consisting of filamentous diatoms, cover was 7.3%, similar to other nearby sites. Encrusting coralline algae were the most abundant algae with a cover of 45%, similar to last year. Articulate coralline algae were present on the tops of rocks with a cover of 0.67%, also similar to last year. Bare substrate cover was 11%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover remained relatively high at 25%. The most dominant miscellaneous invertebrates in this category were *Spirobranchus spinosus*, christmas tree worm, and hydroids. *Diaperoecia californica* were common at this site with a cover of 1.3%. Miscellaneous bryozoan cover, which consisted mostly of *Bugula* spp., was 5.5%. Tunicates and sponges were common and changed little in cover from last year to 3.5% and 0.5%, respectively. The most common tunicates were *Cystodytes lobatus*, an unidentified brown tunicate with white spots, and *Pycnoclavella stanleyi*. No *Styela montereyensis* was observed. *Tethya aurantia* density was 0.074/m<sup>2</sup>. *Corynactis californica* cover was 0.83%. *Balanophyllia elegans* and *Astrangia lajollaensis* covers were 0.17% and 3.5%, similar to recent years. *Lophogorgia chilensis* were abundant on the offshore side of the transect at a density of 0.23/m<sup>2</sup>, similar to last year. Several *Muricea californica* were observed with a density of 0.0028/m<sup>2</sup>. No *Muricea fruticosa* were observed on band transects.

*Strongylocentrotus* spp. remained high, and densities were similar to the past two years. *Strongylocentrotus purpuratus* was the most abundant echinoderm with a density of 28/m<sup>2</sup>. *Strongylocentrotus franciscanus* density was 2.7/m<sup>2</sup>. *Centrostephanus coronatus* were common and density was 0.17/m<sup>2</sup>, similar to last year. *Lytechinus anamesus* were rare with a density of 0.043/m<sup>2</sup>, and only 56 were found for size frequencies. No urchin wasting disease was observed.

No *Ophiothrix spiculata* were observed. *Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.083/m<sup>2</sup> and 0.06/m<sup>2</sup>, respectively. Thirty-eight *P. giganteus* were found for size frequencies and were large with a mean of 140 mm, similar to past years. *Patiria miniata* were common with a density of 0.21/m<sup>2</sup>. *Parastichopus parvimensis* were abundant at a density of 1.2/m<sup>2</sup>, similar to last year. No *Pycnopodia helianthoides* were observed. No sea star wasting disease was observed.

*Megastraea undosa* density remained low at 0.04/m<sup>2</sup>, and only 43 were found for size frequencies. Several juveniles were observed. *Crassedoma giganteum* remained abundant at a density of 0.25/m<sup>2</sup>. Many large ones continue to be observed and their mean size was 90 mm. *Kelletia kelletii* were rare with one observed for a density of 0.0014/m<sup>2</sup>. *Megathura crenulata* were abundant with a density of 0.18/m<sup>2</sup>. *Tegula regina* density was 0.083/m<sup>2</sup>. No *Panulirus interruptus* were observed during band transects. *Aplysia californica* density was 0.083/m<sup>2</sup>, and many large individuals were common.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Similar to last year, fish were abundant and diverse at this site. *Coryphopterus nicholsii* density changed little at 0.46/m<sup>2</sup>, but higher numbers were observed on the roving diver fish count with up to 320 observed. *Alloclinus holderi* density was similar to last year at 0.13/m<sup>2</sup> and up to 31 observed. *Lythrypnus dalli* density was 0.08/m<sup>2</sup> and up to 15 observed. Up to 13 *Oxylebius pictus* were observed, but there were none on 1 m quadrats. *Chromis punctipinnis* were the most abundant fish with up to 1048 adults and 13 juveniles observed. *Oxyjulis californica* were abundant with up to 270 adults and 18 juveniles observed. Twelve female, two juvenile and two male *Semicossyphus pulcher* were observed, similar to last year. *Halichoeres semicinctus* were common with up to 10 females and three males observed. Up to 15 adult *Hypsypops rubicundus* were observed. *Paralabrax clathratus* were abundant with up to 36 adults observed. Up to five adult *Girella nigricans* were observed. Up to 15 adult and two juvenile *Embiotoca jacksoni* were observed, similar to last year. *Rhacochilus vacca* were abundant with up to 48 adults and no juveniles observed. One adult *Sebastodes atrovirens* was observed. One adult *Sebastodes serranoides* was observed. Six adults and one juvenile *Sebastodes serriceps* were observed. One *Sebastodes chrysomelas*, black and yellow rockfish, was observed. One *Sebastodes auriculatus*, brown rockfish, was observed. Seven adult *Sebastodes carnatus*, gopher rockfish, were observed, similar to last year. Two KGBs were observed. One *Scorpaena guttata*, California scorpion fish, was observed. Two *Ornothopias triacis*, snubnose sculpin, were observed. One *Scorpaenichthys marmoratus*, cabezon, was observed. One *Cephaloscyllium ventriosum*, swell shark, was observed. One *Neoclinus* spp., fringehead spp., was observed. *Rhacochilus toxotes*, rubberlip surfperch, were abundant with up 55 adults observed. *Caulolatilus princeps*, ocean whitefish, were abundant with up to 18 observed. Up to six *Medialuna californiensis*, halfmoon, were observed. One *Lythrypnus zebra*, zebra goby, was observed and some very small individuals were noted. A small school of *Atherinops affinis*, topsmelt, was observed with up to 17 fish. Roving diver fish counts were conducted on June 19<sup>th</sup> by three divers and on September 19<sup>th</sup> by five divers observing 26 and 28 species, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on October 1<sup>st</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Little Scorpion, Santa Cruz Island**

**Site #29 SCLS**

**2007 sampling dates: 6/27, 6/28, 9/19.**

**2007 status: Dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

This site continues to be dominated by *Strongylocentrotus* spp. and was almost entirely devoid of macroalgae except on the tops of the taller rocks. Similar to last year there was no *Macrocystis pyrifera*, *Pterygophora californica*, *Laminaria farlowii*, *Desmarestia* spp. or *Cystoseira* spp. present at this site. One juvenile *Eisenia arborea* was observed on top of a large rock, but was not present in our sampling methods. Miscellaneous brown algae cover was 0.17%, similar to past years and mainly consisting of *Dictyota/Pachydictyon* spp. Green algae cover was 0.33%. Miscellaneous red algae, consisting mostly of *Laurencia pacifica*, cover was 12%, similar to last year. Miscellaneous plants cover was 17% and consisted entirely of filamentous diatoms. Encrusting coralline algae cover was 29%, similar to last year. Articulated coralline algae were rare and none were observed on RPCs. Bare substrate cover increased to 21%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* were abundant with a cover of 21%, similar to last year. The most dominant miscellaneous invertebrates were hydroids which were notably abundant on the tops of rocks. Sponge cover was 0.5%. *Tethya aurantia* density was 0.017/m<sup>2</sup> and only 22 were found for size frequencies, similar to last year. Tunicate category cover was 1.7%. Miscellaneous bryozoan cover increased to 9.0%. *Diaperoecia californica* was common in small patches off the main transect and cover was similar to last year at 1.2%. *Corynactis californica*, *Astrangia lajollaensis*, and *Balanophyllia elegans* cover remained similar to last year at 0.5%, 4.0%, and 0.0%, respectively. *Lophogorgia chilensis* were abundant on the offshore/deeper side with a density of 0.13/m<sup>2</sup>, similar to last year. One *Muricea californica* was observed at the entire site and but was not observed on band transects. No *Muricea fruticosa* were observed on band transects.

*Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* remain moderately abundant with densities similar to the past two years at 5.9/m<sup>2</sup> and 11/m<sup>2</sup>, respectively. Most the *S. purpuratus* and *S. franciscanus* were notably large in size relative to other sites nearby that are dominated by sea urchins. *Lytechinus anamesus* were common in the low lying sandy areas with a density of 0.058/m<sup>2</sup>. *Centrostephanus coronatus* were moderately abundant at the site but not along the main transect. Sea urchin wasting disease was observed and we estimated less than 1% of the *S. franciscanus* and *S. purpuratus* were observed with the disease on June 28<sup>th</sup>, but none were observed on September 19<sup>th</sup>.

*Patiria miniata* were moderately abundant for this area with a density of 1.0/m<sup>2</sup>. *Pisaster giganteus* were recorded on 1 m quadrats and 5 m quadrats with densities of 0.21/m<sup>2</sup> and 0.09/m<sup>2</sup>, respectively. No *Pycnopodia helianthoides* were observed on band transects and only one was found at the site for size frequencies. *Linkia columbiae* were relatively abundant. *Parastichopus parvimensis* density was 0.42/m<sup>2</sup>. No sea star wasting disease was observed.

One small *Haliotis corrugata* measuring 41 mm was found under a small rock. *Crassedoma giganteum* were common with a density of 0.058/m<sup>2</sup>, with some notably large individuals. *Megathura crenulata* remained abundant and increased in density to 0.49/m<sup>2</sup>, the highest density of all of the KFM sites. *Cypraea spadicea* density was 0.080/m<sup>2</sup>. Adult and juvenile *Megastraea undosa* were common but patchy, with a density of 0.13/m<sup>2</sup>, similar to last year. *Kelletia kelletii* density was 0.057/m<sup>2</sup> with many small individuals noted. *Tegula regina* density was 0.083/m<sup>2</sup>. *Aplysia californica* were common with a density of 0.028/m<sup>2</sup>. *Panulirus interruptus* density was 0.0014/m<sup>2</sup>, and eight were observed within the transect area during the roving diver fish count.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

This site continued to have a high fish abundance and diversity. *Coryphopterus nicholsii* were the most abundant fish with a density of 3.8/m<sup>2</sup> and up to 447 observed on a roving diver fish count. *Alloclinus holderi* density was 0.21/m<sup>2</sup> and up to nine were observed. *Lythrypnus dalli* were more abundant than last year with a density of 0.08/m<sup>2</sup> and up to 31 observed. In 2006, we visited this site twice and noted more *L. dalli* during the second visit possibly due to the warm water recruitment event between visits. *Oxylebius pictus* were common at 0.04/m<sup>2</sup> and up to 27 observed. *Chromis punctipinnis* were abundant with up to 410 adults and two juveniles observed, similar to past year. *Oxyjulis californica* were common with up to 45 adults and 80 juveniles observed. Two female, three juvenile and one male *Semicossyphus pulcher* were observed Up to five female, two juvenile and three male *Halichoeres semicinctus* were observed. *Hypsypops rubicundus* were abundant with up to 18 adults observed. *Paralabrax clathratus* were common with up to 20 observed on September 19<sup>th</sup> and eight observed on June 27<sup>th</sup>. *Embiotoca jacksoni* were common with up to 14 adults observed. Ten adult *Rhacochilus vacca* were observed. Most of the adult *Sebastes* spp. were in the 15-20 cm category with few large fish present. Up to six adult and no juvenile *Sebastes mystinus* were observed. Fourteen adult *Sebastes atrovirens* were observed. Nine adult and two juvenile *Sebastes serriceps* were observed, similar to last year. One adult *Sebastes carnatus*, gopher rockfish, were observed. Six adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. One *Scorpaena guttata*, California scorpionfish, was observed. Four adult *Rhacochilus toxotes*, rubberlip surfperch, were observed. Seventeen *Phanerodon furcatus*, white surfperch, were observed. One adult *Caulolatilus princeps*, ocean whitefish, was observed. Three adult *Medialuna californiensis*, halfmoon, were observed. Eight *Lythrypnus zebra*, zebra goby, were observed. One *Gymnothorax mordax*, California moray eel, was observed. Roving diver fish counts were conducted on June 27<sup>th</sup> by four divers and on September 19<sup>th</sup> by five divers observing 22 and 29 species, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on August 29<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Pedro Reef, Santa Cruz Island**

**Site #30 SCPR**

**2007 sampling dates: 6/27, 8/9.**

**2007 status: Dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

This site continued to be devoid of macroalgae and dominated by *Strongylocentrotus* spp. No *Macrocystis pyrifera*, *Eisenia arborea*, *Pterygophora californica*, *Laminaria farlowii*, *Cystoseira* spp. or *Desmarestia* spp. were observed, similar to past years. The most abundant algae were filamentous red algae, small red algae turf and *Laurencia pacifica*, all mostly located on the shallower parts of the reef. These algae are all under the miscellaneous red algae category on RPCs which had a cover of 9.2%, similar to recent years. Miscellaneous green algae were not observed on RPCs this year. Miscellaneous plants, consisting of filamentous diatoms cover was 9.7%. Articulated coralline algae cover was 2.3%. Encrusting coralline algae cover was 43%, an increase from last year. Bare substrate cover remained high at 28%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 17%, similar to last year. The most dominant miscellaneous invertebrates were the *Spirobranchus spinosus*, Christmas tree worm, and *Balanus* sp. barnacles. Sponges were rare with a cover of 0.33%. *Tethya aurantia* were common with a density of 0.086/m<sup>2</sup>, similar to last year. *Corynactis californica* were moderately abundant with a cover of 8.2%, similar to last year. *Astrangia lajollaensis* were common with a cover of 2.8%. *Balanophyllia elegans* were common with a cover of 0.33%. Miscellaneous bryozoans cover was 0.33%, similar to last year. *Diaperoecia californica* were not observed on RPCs. *Lophogorgia chilensis* were abundant in some areas with a density of 0.28/m<sup>2</sup>, similar to last year. *Muricea californica* were common and had a density of 0.0056/m<sup>2</sup>. No *Muricea fruticosa* were observed on band transects, but several were present at the site. One large *Pteria sterna* was observed on a *Lophogorgia chilensis*. No tunicates were observed on RPCs. *Diopatra ornata* were common to the low lying areas with 0.83% cover.

*Strongylocentrotus purpuratus* continued to be abundant and dominated the site with a density of 49/m<sup>2</sup>. Most were small with a mean size of 20 mm. *Strongylocentrotus franciscanus* were moderately abundant with a density of 7.5/m<sup>2</sup> and were also small with a mean size of 29 mm. *Centrostephanus coronatus* were common and had a density of 0.08/m<sup>2</sup>, similar to last year. *Lytechinus anamesus* were common in areas on the offshore side of the transect and density increased to 0.86/m<sup>2</sup> on band transects and 1.4/m<sup>2</sup> on 1 m quadrats. We estimated that 1% of *S. purpuratus* and *S. franciscanus* and 1-3% of *Lytechinus anamesus* had signs of wasting disease on August 9<sup>th</sup>.

*Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.083/m<sup>2</sup> and 0.045/m<sup>2</sup>, respectively. *Patiria miniata* were common with a density of 0.13/m<sup>2</sup>, the same as last year. No *Pycnopodia helianthoides* were observed on band transects. *Pachythyone rubra* were cover was 1.8%, similar to last year and were mostly on the western end of the transect. *Parastichopus parvimensis* density was 0.083/m<sup>2</sup>, and were notably small.

No live *Haliotis* spp. were observed. However, one fresh *Haliotis corrugata* shell was found and measured at 39 mm. *Megastraea undosa* were common and small individuals were relatively abundant over most of the transect with a density of 1.0/m<sup>2</sup>. *Tegula regina* were present at the site, but not observed on 1 m quadrats. *Crassedoma giganteum* were notably large at this site with a density of 0.04/m<sup>2</sup>. *Kelletia kelletii* density was 0.0042/m<sup>2</sup>. *Megathura crenulata* were observed on the high relief areas with a density of 0.065/m<sup>2</sup>, similar to recent years. *Cypraea spadicea* density was 0.042/m<sup>2</sup>. *Bursa californica* were common at this site, similar to last year.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Fish were moderately diverse and abundant for a barren area, but less so than last year.

*Coryphopterus nicholsii* were the most abundant fish species with up to 359 observed on the roving diver fish count and a density of 3.7/m<sup>2</sup>. *Alloclinus holderi* were rare with only two observed during the fish count and none on 1 m quadrats, similar to last year. Up to nine *Lythrypnus dalli* were observed but none on 1 m quadrats. *Oxylebius pictus* were moderately abundant with up to 14 observed and a density of 0.042/m<sup>2</sup>. *Chromis punctipinnis* were abundant with up to 232 adults and no juveniles observed. *Oxyjulis californica* were moderately abundant with up to 72 adults and 65 juveniles observed. Up to six female, one juvenile and one male *Semicossyphus pulcher* were observed. Seven female, five juvenile and four male *Halichoeres semicinctus* were observed.

*Hypsypops rubicundus* were common with up to seven adults observed. Fifteen adult and no juvenile *Paralabrax clathratus* were observed. *Girella nigricans* were present with up to six adults observed. One adult *Embiotoca jacksoni* and no juveniles were observed. Two adult *Rhacochilus vacca* was observed. Two adult *Sebastes mystinus* were observed. No *Sebastes atrovirens* or *Sebastes serriceps* were observed. Three adult *Medialuna californiensis*, halfmoon, were observed. Two *Caulolatilus princeps*, ocean whitefish, were observed. Two *Lythrypnus zebra*, zebra goby, were observed. One *Myliobatis californica*, bat ray, was observed. One *Gymnothorax mordax*, California moray eel, was observed. One *Citharichthys stigmaeus*, speckled sanddab, was observed. Roving diver fish counts were conducted on June 27<sup>th</sup> by four divers and on August 9<sup>th</sup> by seven divers observing 18 and 17 species, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 5<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Keyhole, Anacapa Island**

**Site #31 ANKH**

**2007 sampling dates: 05/16, 5/17, 6/27.**

**2007 status: State of transition.**

Overall, this site was similar to last year though there was slightly more macroalgae. *Macrocystis pyrifera* cover remained low at 0.33% and only juveniles were present at the site with a density of 0.17/m<sup>2</sup>. Adult and juvenile *Eisenia arborea* densities were 0.13/m<sup>2</sup> and 0.33/m<sup>2</sup>, respectively and cover was 0.0%, similar to last year. Juvenile *Egregia menziesii* were observed at this site.

Miscellaneous brown algae cover was similar to last year at 15%. Because of the abundance of *Sargassum muticum*, we recorded it separately from other brown algae during RPCs, but then added back to this category during data entry. As a result, this may have slightly increased the total cover due to layering effect as we would not normally call off a category such as brown algae twice if the point landed on two species. Separated out, *Sargassum muticum* covered 7.1% while other brown algae (mostly *Dictyota* sp./*Pachydictyon* sp.) cover was 7.5%. *Cystoseira* spp. cover was 0.17%. Green algae cover was 1.2%. *Codium setchellii* was common. Miscellaneous red algae continued to decrease for the second year with a cover of 15%. Miscellaneous plants consisting of mainly of filamentous diatoms cover remained relatively high at 22% but was a large decline from last year. Articulated coralline algae remained rare with a cover of 0.5% and encrusting coralline algae cover changed little at 42%. Miscellaneous plants consisting of mainly of filamentous diatoms cover remained relatively high at 22% but was a large decline from last year Bare substrate was higher than last year but similar to the year before at 16%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover remained high at 25%. The most common invertebrates in this category were gorgonians and mostly *Eugorgia rubens*. Miscellaneous bryozoan cover was 9.5%, similar to last year. *Diaperoecia californica* cover was 0.17%. No sponge were observed on RPCs. *Tethya aurantia* were not observed during band transects, and none were found for size frequencies. Tunicate cover was 0.83%. *Aplysia californica* density was 0.032/m<sup>2</sup>. *Corynactis californica* was not observed on RPCs. *Astrangia lajollaensis* cover was 0.67%. All three gorgonian species were present at similar densities to recent years with *Lophogorgia chilensis* at 0.32/m<sup>2</sup>, *Muricea fruticosa* at 0.0083/m<sup>2</sup> and *Muricea californica* at 0.040/m<sup>2</sup>.

*Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* were common and mainly utilizing crevice habitat. Their densities were similar to last year at 3.3/m<sup>2</sup> and 5.5/m<sup>2</sup>, respectively. *Centrostephanus coronatus* was common at 0.38/m<sup>2</sup>, with mostly large individuals present. *Lytechinus anamesus* abundance increased to 0.011/m<sup>2</sup>. We estimated less than 1% of the *S. purpuratus* and *S. franciscanus* were observed with wasting disease during sampling in May.

*Patiria miniata* density was high for this site and sites close by with an increase to 2.5/m<sup>2</sup>. *Pisaster giganteus* were counted on 1 m quadrats and 5 m quadrats with densities of 0.042/m<sup>2</sup> and 0.035/m<sup>2</sup>, respectively and both higher than last year. *Pycnopodia helianthoides* were not observed on band transects. *Parastichopus parvimensis* density was 1.3/m<sup>2</sup> with several juveniles observed. No sea star wasting disease was observed.

*Kelletia kelletii* abundance was similar to past years at 0.0056/m<sup>2</sup> with several juveniles observed. *Megathura crenulata* were rare at 0.0097/m<sup>2</sup> and juveniles were also observed. *Crassedoma giganteum* density declined to 0.038/m<sup>2</sup>. Three *Panulirus interruptus* were observed at the site and one was on band transects for a density of 0.0014/m<sup>2</sup>. *Cypraea spadicea* density was 0.25/m<sup>2</sup>. *Megastraea undosa* density was 1.8/m<sup>2</sup>, similar to last year and adults were common and juveniles moderately abundant.. *Tegula regina* density was 0.042/m<sup>2</sup>. *Octopus* spp. were common at this site.

Fish abundance was less than in previous years and diversity was similar to nearby sites. This site is within the boundaries of a conservation area where reef fish are protected but select species fish are not. *Coryphopterus nicholsii* density was 0.50/m<sup>2</sup> and up to 145 were observed on the roving diver fish count. *Alloclinus holderi* remained abundant at this site, but density declined to 0.63/m<sup>2</sup> and up to 50 were observed. *Lythrypnus dalli* density was 0.083/m<sup>2</sup> and up to 35 observed. *Oxylebius pictus* density was 0.042/m<sup>2</sup> with up to nine observed. *Chromis punctipinnis* were the most abundant fish with up to 435 adults observed and no juveniles. *Oxyjulis californica* were less common than in previous years with up to 36 adults and no juveniles observed. Up to five female, seven juvenile and one male *Semicossyphus pulcher* were observed. Up to 14 female, 12 juvenile and three male *Halichoeres semicinctus* were observed. Up to six adult *Hypsypops rubicundus* were observed. No *Girella nigricans* were observed. Up to six adult and no juvenile *Paralabrax clathratus* were observed. Nine adult and no juvenile *Embiotoca jacksoni* were observed. No *Rhacochilus vacca* were observed. No *Sebastes mystinus* or *Sebastes atrovirens* were observed. Up to three adults and one juvenile *Sebastes serriceps* were observed. Up to two adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. Up to two adult *Medialuna californiensis*, halfmoon, were observed. Fourteen *Lythrypnus zebra*, zebra goby, were observed. One *Myliobatis californica*, bat ray, was observed. Roving diver fish counts were conducted on June 27<sup>th</sup> by four divers observing 15 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 5<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: East Fish Camp, Anacapa Island**

**Site #32 ANEFC**

**2007 sampling dates: 8/7, 9/14.**

**2007 status: Dominated by *Ophiothrix spiculata*, *Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus*.**

Similar to last year, this site was dominated by echinoderms and mostly devoid of macroalgae. No *Macrocystis pyrifera*, *Eisenia arborea*, *Pterygophora californica* or *Laminaria farlowii* were observed, same as last year. We neglected to take specific notes, but we are nearly positive that *Desmarestia* spp., *Cystoseira* spp., *Gelidium* spp., and *Gigartina* spp. were also absent from this site. Miscellaneous red algae cover remained similar to last year at 5.7%. In this category, *Laurencia pacifica* was most common algae and was found predominately on the tops of rocks and ridges. Green algae and miscellaneous brown algae were rare with none observed during RPCs. Miscellaneous plants consisting of filamentous diatoms cover was 0.17%. No articulated coralline algae were observed on RPCs and it was rare overall. Encrusting coralline algae cover was 50%, similar to last year. Bare substrate cover was 31%, also similar to last year.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 5.7%, similar to past years. The most common invertebrate in this category was *Spirobranchus spinosus*, Christmas tree worms. No tunicates or sponges were observed on RPCs and were relatively rare at the site. *Tethya aurantia* density was 0.044/m<sup>2</sup>, similar to last year. Miscellaneous bryozoans were also rare with a cover of 0.17%. *Diaperoecia californica* were present in small patches on the steep sides of large rocks, but none were observed on RPCs. *Corynactis californica* was moderately abundant at 7.0%, similar to last year. *Balanophyllia elegans* and *Astrangia lajollaensis* were rare with covers of 0.0% and 0.3% respectively, similar to last year. All three species of gorgonians were present with densities of *Lophogorgia chilensis* at 0.017/m<sup>2</sup>, *Muricea fruticosa* at 0.0028/m<sup>2</sup>, and *Muricea californica* at 0.011/m<sup>2</sup>.

*Strongylocentrotus purpuratus* were abundant with a density of 49/m<sup>2</sup>, a decrease from last year. Juvenile *S. purpuratus* were present. *Strongylocentrotus franciscanus* were also abundant at 12/m<sup>2</sup>, similar to last year. *Centrostephanus coronatus* remained relatively abundant with a density of 0.88/m<sup>2</sup>. At least two juvenile *C. coronatus* were observed. *Lytechinus anamesus* were present in the low lying sandy areas at 0.76/m<sup>2</sup>, an increase from last year. On August 7<sup>th</sup> and on September 14<sup>th</sup>, we estimated prevalence of sea urchin wasting disease at 1-3% of both *Strongylocentrotus franciscanus* and *S. purpuratus*.

*Pisaster giganteus* were rare and notably large with a mean size of 188 mm, but only three were found on the site for size frequencies. They were counted on 1 m quadrats and 5 m quadrats with densities of 0.042/m<sup>2</sup> and 0.010/m<sup>2</sup>, respectively. *Patiria miniata* were common with a density of 1.0/m<sup>2</sup>, similar to last year. No *Pycnopodia helianthoides* were observed at the site. *Parastichopus parvimensis* density was 0.29/m<sup>2</sup>, similar to past years. *Ophiothrix spiculata* were abundant on the northern end of the transect with a cover of 11%, similar to last year. On August 7<sup>th</sup>, two *Patiria miniata* were observed with wasting disease.

No live *Haliotis* spp. were found at the site. *Megastraea undosa* were moderately abundant at 0.63/m<sup>2</sup>, similar to last year. *Kelletia kelletii* were common with a density of 0.15/m<sup>2</sup>. Small and large *Megathura crenulata* were common at 0.19/m<sup>2</sup>. *Crassedoma giganteum* were common on the large boulders with a density of 0.043/m<sup>2</sup>. *Aplysia californica* were moderately abundant at 0.17/m<sup>2</sup>.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number recorded. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Overall, fish diversity and abundance increased at this site. *Coryphopterus nicholsii* density was 3.2/m<sup>2</sup> and up to 852 were observed during the roving diver fish count, an increase from last year. Large aggregations of 15-25 *C. nicholsii* were commonly observed in small sand patches. The density of *Alloclinus holderi* was 0.38/m<sup>2</sup> with up to 22 observed. Up to five *Lythrypnus dalli* were observed with a density of 0.0/m<sup>2</sup>. *Oxylebius pictus* were common with up to 33 observed and none observed during 1 m quadrats. *Chromis punctipinnis* were common with up to 284 adults and 20 juveniles observed. There were up to 16 adult and two juvenile *Oxyjulis californica* observed. Up to 16 female, no juvenile and four male *Halichoeres semicinctus* were observed. Up to four female, three juvenile and no male *Semicossyphus pulcher* were observed. Up to 24 *Hypsypops rubicundus* were observed. Adult *Paralabrax clathratus* were common with up to nine observed, but no juveniles. Up to eight adult *Girella nigricans* were observed. One adult *Embiotoca jacksoni* was observed. Eight adult *Rhacochilus vacca* were observed. Five adult and one juvenile *Sebastes serriceps* were observed. Up to five juvenile *S. atrovirens* were observed with no adults recorded. Six adult *Sebastes chrysomelas*, black and yellow rockfish, were observed. Up to six KGB were observed. One *Scorpaena guttata*, California scorpionfish, was observed. One *Artedius corallines*, coralline sculpin, was observed. One *Rhacochilus toxotes*, rubberlip surfperch, was observed. Up to four *Medialuna californiensis*, halfmoon, were observed. *Caulolatilus princeps*, ocean whitefish, were present with up to three adults observed. *Lythrypnus zebra*, zebra goby, were common with up to 14 observed. Two *Pleuronichthys coenosus*, CO turbot, were observed. Roving diver fish counts were conducted on August 7<sup>th</sup> by seven divers observing 23 species and on September 14<sup>th</sup> by seven divers observing 21 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 11<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Black Sea Bass Reef, Anacapa Island**

**Site #33 ANBSBR**

**2007 sampling dates: 8/20.**

**2007 status: Dominated by *Ophiothrix spiculata*.**

This site continues to be dominated by *Ophiothrix spiculata* with most of the site being devoid of macroalgae, though there was a small increase this year. Most algae and invertebrates were observed on the tops of large rocks and under ledges on the eastern part of the transect. There were only two unhealthy subadult and several juvenile *Macrocystis pyrifera* present at the site. Subadult and juvenile densities were 0.005/m<sup>2</sup> and 0.042/m<sup>2</sup>, respectively and cover was 1.0%. There were no *Eisenia arborea*, *Pterygophora californica*, *Laminaria farlowii*, *Desmarestia* spp. or *Cystoseira* spp. observed. Miscellaneous red algae cover increased to 23% with filamentous and red algae (mostly *Laurencia pacifica*) common under the dense *O. spiculata* cover. Several *Gigartina corymbifera* were observed, more than previous years at a cover of 0.33%. Miscellaneous brown algae cover was 1.3%. Green algae cover increased to 4.8% and included *Codium fragile* and *Codium setchellii*. Miscellaneous plants cover consisting of filamentous diatoms was 6.2%. Encrusting coralline algae cover was 82%. Articulated coralline algae cover was 0.33%. Bare substrate cover was 5.0%, similar to last year.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 4.5% and mostly consisted of *Spirobranchus spinosus*, the christmas tree worm. Sponges were common at 0.50% cover. *Tethya aurantia* density was 0.0069/m<sup>2</sup>, and most were large. Tunicate cover was 0.17%, same as last year. Miscellaneous bryozoans were common at 3.7%. *Diaperoecia californica* was not observed on RPCs this year. *Corynactis californica* were common at 2.3%. *Lophogorgia chilensis* density was 0.014/m<sup>2</sup>. *Muricea fruticosa* and *Muricea californica* were both rare with densities of 0.0028/m<sup>2</sup> and 0.0014/m<sup>2</sup>, respectively.

*Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* densities were 1.9/m<sup>2</sup> and 2.2/m<sup>2</sup>, respectively. *Centrostephanus coronatus* were moderately abundant at 0.17/m<sup>2</sup>. *Lytechinus anamesus* were rare with only one observed and none on band transects. Sea urchin wasting disease was not observed at this site.

Similar to last year, *Ophiothrix spiculata* were extremely abundant with a cover of 76%. *Patiria miniata* density was 0.21/m<sup>2</sup>. *Pisaster giganteus* counted on 1 m quadrats and 5 m quadrats with densities of 0.042/m<sup>2</sup> and 0.045/m<sup>2</sup>, respectively. No *Pycnopodia helianthoides* were observed. *Parastichopus parvimensis* density was higher than the past two years at 1.1/m<sup>2</sup>, and small ones were commonly observed. No sea star wasting disease was observed.

No *Haliotis* spp. were observed at the site. *Megastrea undosa* were moderately abundant with a density of 0.17/m<sup>2</sup>. *Tegula regina* were not observed on 1 m quadrats, but several were measured for size frequencies. *Kelletia kelletii* were rare and none were observed on band transects. *Megathura crenulata* were abundant with a density of 0.16/m<sup>2</sup>. *Crassedoma giganteum* density was 0.0056/m<sup>2</sup>,

similar to last year. *Panulirus interruptus* were abundant this year at 0.047/m<sup>2</sup>, and most were large being over legal size.

This site had a low diversity of fish and less abundance than years past. *Coryphopterus nicholsii* were the most abundant fish with a density of 1.0/m<sup>2</sup> and up to 430 counted. *Alloclinus holderi* were relatively abundant at 0.83/m<sup>2</sup> and up to 37 counted with small and some were notably large. There were up to 138 *Lythrypnus dalli* observed, a noticeable increase from last year, and had a density of 0.21/m<sup>2</sup>. Three *Oxylebius pictus* were observed, but none on 1 m quadrats. *Chromis punctipinnis* were moderately abundant throughout the water column with up to 405 adults and 49 juveniles observed. No *Oxyjulis californicus* were observed. Six females, no juveniles and one male *Semicossyphus pulcher* were observed. One tagged *S. pulcher* was observed, most likely the same tagged female observed last year. One female, one juvenile and no male *Halichoeres semicinctus* were observed. Up to five adult *Hypsypops rubicundus* were observed. Two *Girella nigricans* were observed. Only one adult *Embiotoca jacksoni* was observed. Three juvenile *Sebastes atrovirens* were observed and no adults. *Sebastes serriceps* were common with up to two adults and six juveniles observed. One *Scorpaena guttata*, California scorpionfish, was observed. There were up to four *Caulolatilus princeps*, ocean whitefish, observed. *Medialuna californiensis*, halfmoon, were common with up to 11 observed in the midwater. A school of up to 35 *Sphyraena argentea*, Pacific barracuda, was observed swimming through the transect. No *Stereolepis gigas*, black sea bass were observed this year. Roving diver fish counts were conducted on August 20<sup>th</sup> by four divers observing 17 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 4<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Lighthouse, Anacapa Island**

**Site #34 ANLH**

**2007 sampling dates: 8/29, 8/30, 9/14.**

**2007 status: Dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

This site was similar to last year with very little algae present and continues to be dominated by *Strongylocentrotus* spp. Most of the macroalgae were either growing epiphytically on gorgonians or on the tops of large rocks. Several adult and juvenile *Macrocystis pyrifera* and *Eisenia arborea* were present. There was a small kelp forest present just inshore of the sampling area. Fishing pressure appears to be high in this area as sport fishing boats are frequently seen here, and several strands of monofilament line and a fishing pole were found.

Overall, macroalgae were rare at this site. No *Macrocystis pyrifera*, *Eisenia arborea*, *Laminaria farlowii*, *Pterygophora californica*, *Cystoseira* spp. or *Desmarestia* spp. were recorded on 1 m quadrats, 5 m quadrats or RPCs. Four mature adult *M. pyrifera* were found within the transect area for size frequencies. No green algae were observed on RPCs. Miscellaneous brown algae cover was rare at 0.17%. Miscellaneous red algae cover was 2.5% and consisted mostly of filamentous red algae. Miscellaneous plants, consisting of filamentous diatoms cover was 3.7%. Articulated coralline algae were rare with a cover of 0.17%. Encrusting coralline algae cover was 34%, similar to last year. Bare substrate cover increased substantially to 41%.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* cover was 13%, same as the last two years. The most common miscellaneous invertebrates in this category were hydroids followed by *Spirobranchus spinosus*, christmas tree worm. Tunicate cover continued to decline for the second year with none observed RPCs. Miscellaneous bryozoans also continued to decline for the second year to a cover of 0.5%. *Diaperoecia californica* were common on the steep sides of large boulders but none were observed on RPCs. Sponges were not observed on RPCs. *Tethya aurantia* density was 0.068/m<sup>2</sup>, similar to previous years. *Phragmatopoma californica* cover declined to 0.33% and was mostly present from 0-20 m along the transect. *Diopatra ornata* were common with a cover of 7.2%, similar to previous years. *Corynactis californica* cover was 0.83%. *Astrangia lajollaensis* cover was 0.5%. *Balanophyllia elegans* were not observed on RPCs. All the gorgonian species were notably abundant with *Muricea californica* being the most abundant at 0.32/m<sup>2</sup>, *Muricea fruticosa* density at 0.047/m<sup>2</sup> and *Lophogorgia chilensis* at 0.13/m<sup>2</sup>, all similar to past years.

*Strongylocentrotus* spp. continued to dominate the site, similar to last year. *Strongylocentrotus franciscanus* continued to be abundant at a density of 9.6/m<sup>2</sup>. *Strongylocentrotus purpuratus* density remained high but decreased to 35/m<sup>2</sup>. *Centrostephanus coronatus* density remained high at 0.46/m<sup>2</sup>, similar to the past two years. *Lytechinus anamesus* density was similar to past years and they were counted on both band transects and 1 m quadrats with densities of 0.018/m<sup>2</sup> and 0.13/m<sup>2</sup>, respectively. Sea urchin wasting disease was observed on August 29<sup>th</sup> with an estimated prevalence of less than 1% for both *S. franciscanus* and *S. purpuratus*. On September 14<sup>th</sup>, we estimated

prevalence of 5% for *S. purpuratus*. Disease was notable cause of mortality as *Strongylocentrotus purpuratus* tests were common and some of the diseased sea urchins appeared near death.

*Patiria miniata* density was 0.67/m<sup>2</sup>, similar to last year. *Pisaster giganteus* were counted on both 1 m quadrats and 5 m quadrats with densities of 0.083/m<sup>2</sup> and 0.040/m<sup>2</sup>, respectively, an increase from last year. Several small, emergent *P. giganteus* were observed in crevices. There were also many small emergent *Parastichopus parvimensis*, presumably from last year's recruitment event that has been observed at several other sites. *Parastichopus parvimensis* density was 0.38/m<sup>2</sup>, similar to last year but a gradual increase since we began monitoring in 2005. Several *Pisaster ochraceus* and one *Orthasterias koehleri* were observed at the site. On August 29<sup>th</sup>, sea star wasting disease prevalence was estimated in 1% of *Patiria miniata*, but only two were observed with the disease on September 14th.

*Megathura crenulata* density was 0.044/m<sup>2</sup>, lower than the past two years. *Crassedoma giganteum* were moderately abundant on the larger rocks with a density were not as abundant as the past two years at 0.011/m<sup>2</sup>, a gradual decline since we began monitoring in 2005. *Kelletia kelletii* were abundant with a density of 0.24/m<sup>2</sup> and most were large. *Tegula regina* density was 0.042/m<sup>2</sup>. *Megastraea undosa* density remained low at 0.17/m<sup>2</sup>, and most were large with a mean size of 85 mm. *Lithopoma gibberosa* were rare with a density of 0.083/m<sup>2</sup>. *Cypraea spadicea* were common at 0.083/m<sup>2</sup>. *Aplysia californica* were rare on band transects at 0.0083/m<sup>2</sup>. Several *Panulirus interruptus* were observed and had a density of 0.0042/m<sup>2</sup>. One live large *Pteria sterna*, pearl oyster was found on a gorgonian.

We were able to conduct roving diver fish counts at this site two times this year. The counts are reported with the highest number observed. If there is a large discrepancy in the range it is stated accordingly. The roving diver fish counts are reported in the Appendices and all results can be viewed there.

Fish diversity was low, but overall abundance was relatively high at this site this year. Very few rockfish were present. *Coryphopterus nicholsii* were abundant with a density of 3.0/m<sup>2</sup> and up to 411 observed. *Alloclinus holderi* were common, with a density of 0.21/m<sup>2</sup> and up to eight were observed, also an increase from last year. No *Lythrypnus dalli* were observed. *Oxylebius pictus* were abundant with up to 33 observed, and none on 1 m quadrats. *Chromis punctipinnis* were the most abundant fish with up to 589 adults and 25 juveniles observed. *Oxyjulis californica* were common with up to 265 adults and two juveniles observed. Up to five female, six juvenile and no male *Semicossyphus pulcher* were observed. Nine female, six male, and six juvenile *Halichoeres semicinctus* were observed. These juveniles appeared to be from last year. *Hypsypops rubicundus* were common with up to 16 adults observed. Up to 11 adult and no juvenile *Paralabrax clathratus* were observed. Up to nine adult *Girella nigricans* were observed. There were up to three adult *Embletoeca jacksoni* observed. No *Embletoeca lateralis* were observed. Seven *Rhacochilus vacca* were observed. No *Sebastes mystinus*, *Sebastes atrovirens*, or *Sebastes serranoides* were observed. There was one adult and one juvenile *Sebastes serviceps* observed. Two *Sebastes chrysomelas*, black and yellow rockfish,

were observed. One *Scorpaena guttata*, California scorpionfish, was observed. Two *Caulolatilus princeps*, ocean whitefish, were observed. Up to 15 adult *Medialuna californiensis*, halfmoon, were observed. One *Lythrypnus zebra*, zebra goby, was observed. Two *Pleuronichthys coenosus*, CO turbot, were observed. One *Myliobatis californica*, bat ray, was observed and are a common observation at this site. Roving diver fish counts were conducted on August 30<sup>th</sup> by three divers and September 14<sup>th</sup> by five divers observing 18 and 19 species, respectively.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 12<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Webster's Arch, Santa Barbara Island**

**Site #35 SBWA**

**2007 sampling dates: 6/4.**

**2007 status: Site dominated by *Strongylocentrotus purpuratus* and *Strongylocentrotus franciscanus*.**

This site was similar to last year being dominated by *Strongylocentrotus purpuratus* and nearly devoid of macroalgae. There were several juvenile *Macrocystis pyrifera* observed along the transect, but none were observed during 1 m quadrats or 5 m quadrats. Adult *Eisenia arborea* were observed on the top of larger rocks where there were no sea urchins, but there appeared to be fewer individuals than last year. No *Macrocystis pyrifera*, *Laminaria farlowii*, *Eisenia arborea* *Pterygophora californica*, *Desmarestia spp*, or *Cystoseira spp*. were recorded. Green algae cover was 3.0%, similar to past years. Miscellaneous red algae cover was 10.0% similar to past years and consisted mostly of *Laurencia pacifica* and other filamentous red algae. Miscellaneous plant cover, consisting of filamentous diatoms cover was 2.3%. Articulate coralline algae was common on the tops of rocks with a cover of 1.3%. Encrusting coralline algae cover was 56%. Bare substrate cover was 9.5%, lower than the past two years.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* increased to 18% with *Spirobranchus spinosus* and hydroids being the most dominant invertebrates in this category. There were also a moderate amount of amphipod tube mats noted along the transect. Tunicate cover was 1.8%. Sponge cover was of 0.67%. *Tethya aurantia* were rare at 0.0014/m<sup>2</sup>. Miscellaneous bryozoan cover was 2.0%. *Corynactis californica* were common over most of the transect with a cover of 7.5%, similar to last year. *Balanophyllia elegans* and *Astrangia lajollaensis* covers were 1.3% and 0.17%, respectively. *Lophogorgia chilensis* and *Muricea californica* were also both rare with densities of 0.0069/m<sup>2</sup> and 0.0069/m<sup>2</sup>, respectively. No *Muricea fruticosa* were observed on band transects.

This site continues to be dominated by *Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* with a fairly uniform distribution throughout the site, similar to past years.

*Strongylocentrotus franciscanus* and *S. purpuratus* were abundant with densities of 10/m<sup>2</sup> and 80/m<sup>2</sup>, respectively. *Strongylocentrotus franciscanus* and *S. purpuratus* were both mostly small in size with means of 29 mm and 16 mm, respectively. *Centrostephanus coronatus* were common at a density of 0.29/m<sup>2</sup>. *Lytechinus anamesus* were uncommon with a density of 0.0056/m<sup>2</sup>, and only three found for size frequencies. Sea urchin wasting disease was prevalent and we estimated that less than 5% of the *S. franciscanus* and *S. purpuratus* showed signs of the disease.

*Ophiothrix spiculata* were only present on the first 15 m of the transect and off that east end. Their cover was 6.5%, similar to recent years. *Patiria miniata* were relatively abundant for this Island at a density of 1.4/m<sup>2</sup>, similar to past years. *Pisaster giganteus* were moderately abundant as well and were counted on both 1 m and 5 m quadrats with densities of 0.083/m<sup>2</sup> and 0.050/m<sup>2</sup>, respectively. *Pycnopodia helianthoides* density was 0.0069/m<sup>2</sup> and they were more common than last year with ten large individuals found for size frequencies. *Parastichopus parvimensis* density was 0.29/m<sup>2</sup>. No sea star wasting disease was observed.

*Cypraea spadicea* density was low at 0.083/m<sup>2</sup>. *Lithopoma undosa* were abundant at a density of 0.50/m<sup>2</sup> and most were medium-sized (50-59 mm). *Lithopoma gibberosa* were rare with a density of 0.042/m<sup>2</sup>, same as last year, and only two found for size frequencies. *Tegula regina* were relatively abundant and mostly present on the tops of rocks with a density of 0.083/m<sup>2</sup>. *Kelletia kelletii* were rare at 0.0028/m<sup>2</sup>. *Megathura crenulata* density continued to increase for the second year and were abundant at a density of 0.15/m<sup>2</sup>. *Crassedoma giganteum* density was 0.028/m<sup>2</sup>. *Aplysia californica* were abundant and small over the entire transect with a density of 0.26/m<sup>2</sup>, higher than last year. Several *Panulirus interruptus* were observed along the transect at 0.0056/m<sup>2</sup>. Near the KFM transect we found one small (20 mm) fresh *Haliotis corrugata* shell.

The fish at this site were low in abundance and diversity, similar last year. *Coryphopterus nicholsii* density was 0.042/m<sup>2</sup> and up to 31 individuals were observed during the roving diver fish count. *Alloclinus holderi* were rare and not observed on the 1 m quadrats, and only two were observed during the fish count. No *Lythrypnus dalli* were observed. *Oxylebius pictus* were common with a density of 0.042/m<sup>2</sup> and up to 23 observed. *Chromis punctipinnis* were the most abundant fish at this site with up to 228 adults observed. No *Oxyjulis californica* were observed. Seven female, no juvenile and up to two male *Semicossyphus pulcher* were observed. One juvenile *Halichoeres semicinctus* was observed. *Hypsypops rubicundus* adults were common with up to ten adults observed. No *Girella nigricans* were observed. One juvenile *Sebastes serriceps* was observed. No *Embiotocidae* spp. were observed. Up to three adult *Sebastes chrysomelas*, black and yellow rockfish, were observed, similar to last year. One *Scorpaenichthys marmoratus*, cabezon, was observed. Three *Ornothopias triacis*, snubnose sculpin, were observed. Up to two large *Gymnothorax mordax*, California moray eel, were observed. Roving diver fish counts were conducted on June 4<sup>th</sup> by three divers observing 14 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on June 13<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. The loggers were not within factory specifications of 0.2°C of each other. There was a larger than average difference between the two loggers (0.24°C) and we used the data from the newer of the loggers.

**Location: Graveyard Canyon, Santa Barbara Island**

**Site #36 SBGC**

**2007 sampling dates: 6/6.**

**2007 status: Dominated by *Ophiothrix spiculata*, *Strongylocentrotus purpuratus*, and *Strongylocentrotus franciscanus*.**

This site appeared similar to last year and remained dominated by echinoderms. The first half of the transect was dominated by *Ophiothrix spiculata* and *Strongylocentrotus* spp. were moderately abundant on all of the rocky substrate. There were no significant changes in macroalgae. Several juvenile *Macrocystis pyrifera* plants were observed along the transect, but no adults. No other brown algae indicator species were observed at the site and other algae was rare. Green algae cover was 0.17%. Miscellaneous red algae cover was 1.2% and consisted mostly of *Laurencia pacifica* and filamentous red algae. *Dictyota/Pachydictyota* spp. were observed along the transect, similar to last year. Miscellaneous plants consisting of filamentous diatoms cover remain low at 0.17%. Encrusting coralline algae were abundant with a cover of 52% and no articulated coralline algae were observed on RPCs. Bare substrate cover remained high at 42%. This site appears to have the potential for a lot of sand movement.

Miscellaneous invertebrate excluding *Ophiothrix spiculata* cover was 4.0% with hydroids being the most dominant invertebrate in this category. No sponges were observed during RPCs. *Tethya aurantia* were common with a density of 0.076/m<sup>2</sup>. *Corynactis californica* cover remained similar to last year at 2.3%. *Balanophyllia elegans* were not observed on RPCs. *Astrangia lajollaensis* cover was 0.67%. *Lophogorgia chilensis*, *Muricea fruticosa* and *Muricea californica* were all present at this site, similar to most Santa Barbara Island sites, with densities of 0.060/m<sup>2</sup>, 0.0028/m<sup>2</sup> and 0.025/m<sup>2</sup>, respectively.

*Strongylocentrotus franciscanus* and *Strongylocentrotus purpuratus* were present in similar densities as last year at 4.5/m<sup>2</sup> and 14.7/m<sup>2</sup>, respectively. *Centrostephanus coronatus* was present at a density of 0.042/m<sup>2</sup>, same as last year. *Lytechinus anamesus* were also abundant at 0.43/m<sup>2</sup>. Several *S. franciscanus* with sea urchin wasting disease were observed.

*Ophiothrix spiculata* continued to increase for the second year and continued to be the most dominant invertebrate with a cover of 33%. *Pisaster giganteus* were not observed on 1 m quadrats this year and were rare on 5 m quadrats at 0.0050/m<sup>2</sup>. Only 22 were found along the transect for size frequencies. *Patiria miniata* density was low at 0.042/m<sup>2</sup>, but we were common at the site. No *Pycnopodia helianthoides* were observed. *Parastichopus parvimensis* density was 0.083/m<sup>2</sup>, similar to past years. No sea star wasting disease was observed.

*Megathura crenulata* density was 0.015/m<sup>2</sup>, and only 14 could be found for size frequencies. *Megastraea undosa* density remained low at 0.083/m<sup>2</sup>. *Cypraea spadicea* density was 0.42/m<sup>2</sup>. *Aplysia californica* were more abundant than previous years, at 0.16/m<sup>2</sup>. *Kelletia kelletii* were rare with a density of 0.0014/m<sup>2</sup>. *Crassedoma giganteum* were also rare with a density of 0.0028/m<sup>2</sup>. One small (~30 mm) live *Haliotis fulgens* was found inshore of the transect under a cobble stone.

Fish diversity and abundance remained low at this site. *Coryphopterus nicholsii* density remained low at 0.33/m<sup>2</sup> and up to 144 were observed during roving diver fish count. No *Lythrypnus dalli* were observed at the site this year. *Alloclinus holderi* and *Oxylebius pictus* were rare with none observed during 1 m quadrats and only three *O. pictus* and four *A. holderi* observed during roving diver fish count. *Chromis punctipinnis* were rare with up to seven adults and no juveniles observed. No *Oxyjulis californicus* were observed. One female, two juvenile and one male *Semicossyphus pulcher* were observed. One female, but no male or juvenile *Halichoeres semicinctus* were observed. No *Hypsypops rubicundus* were observed. No *Paralabrax clathratus* were observed. No *Girella nigricans* were observed. One *Sebastes miniatus*, vermillion rockfish juvenile, and one KGB was observed. Three *Orthopias triacus*, snubnose sculpin, and one *Artedius corallinus*, coralline sculpin, were observed. One *Scorpaenichthys marmoratus*, cabezon, and one *Myliobatis californica*, bat ray, were also observed. Up to four *Citharichthys stigmaeus*, speckled sanddab, were observed in the sandy areas. Roving diver fish count was conducted on June 6<sup>th</sup> with four divers observing 13 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on September 19<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

**Location: Southeast Reef, Santa Barbara Island**

**Site #37 SBSER**

**2007 sampling dates: 5/24.**

**2007 status: Half dominated by a mature kelp forest and half dominated by *Strongylocentrotus* spp.**

This site continued to be a mature and diverse kelp forest on the eastern half of the transect and was dominated by *Strongylocentrotus purpuratus* and *S. franciscanus* on the western half. On the eastern end of the transect (0 m – 40 m), *Macrocystis pyrifera* adult, subadult and juvenile plants were healthy and abundant with densities of 0.17/m<sup>2</sup>, 0.09/m<sup>2</sup> and 0.17/m<sup>2</sup>, respectively and a cover of 5.3%. The *M. pyrifera* was notably healthier than last year and their overall densities have increased. *Laminaria farlowii* were rare and were not observed during sampling. *Cystoseira* spp. cover was 0.33% cover, same as last year. *Eisenia arborea* adult and juvenile densities increased slightly to 0.29/m<sup>2</sup> and 0.083/m<sup>2</sup>, respectively and cover was 2.0%. No *Pterygophora californica* was observed. Green algae cover was 0.5%. Miscellaneous red and brown algae covers were 16% and 2.0% respectively. *Desmarestia* spp. was rare at 0.67% cover. *Gelidium* spp. was observed for the first time on RPCs, with a cover of 0.33%. Miscellaneous plants, consisting mostly of filamentous diatoms, cover was 6.3%. Encrusting coralline algae cover was 44%. Articulated coralline algae cover was 4.0%. Bare substrate cover was 9.3%, lower than the past two years.

Miscellaneous invertebrates excluding *Ophiothrix spiculata* were abundant with a cover of 22%. The most abundant invertebrates in this category were amphipod tube mats, anemones (*Sagartia* sp./*Cactosoma* sp.) and hydroids. Other bryozoans were relatively abundant at 8.0% cover, similar to last year. Tunicates were abundant at 9.7% and were mostly present in the kelp forest. The most prevalent tunicates were *Aplidium* spp. and other encrusting tunicates. Sponge cover was 0.17%. *Tethya aurantia* density remained low at 0.0028/m<sup>2</sup>, and only one was found for size frequencies. *Corynactis californica*, *Balanophyllia elegans* and *Astrangia lajollaensis* covers remained low at 0.0% 0.0% and 0.33%, respectively. *Lophogorgia chilensis*, *Muricea californica*, and *M. fruticosa* were relatively rare with densities of 0.017/m<sup>2</sup>, 0.0097/m<sup>2</sup> and 0.0/m<sup>2</sup>, respectively. *Diopatra ornata* were present in the low lying areas with a cover of 0.83%.

Both *Strongylocentrotus franciscanus* and *S. purpuratus* were common along the transect but were most abundant along the western half of the transect. Their densities were 14.1/m<sup>2</sup> and 10.6/m<sup>2</sup>, respectively, similar to last year. *Centrostephanus coronatus* were common with a density of 0.25/m<sup>2</sup>. *Lytechinus anamesus* were not observed on band transects and were rare with only one observed for size frequencies. Sea urchin wasting disease was rare and was only observed in one *S. purpuratus* and one *S. franciscanus*.

*Pisaster giganteus* noticeably declined in density were recorded on 1 m quadrats and 5 m quadrats at 0.083/m<sup>2</sup> and 0.045/m<sup>2</sup>, respectively. *Patiria miniata* were rare with a density of 0.042/m<sup>2</sup>, and only one was found for size frequencies. No *Pycnopodia helianthoides* were observed. *Parastichopus parvimensis* were common at 1.5/m<sup>2</sup>, with several small recruits observed along the transect.

*Megastraea undosa* density was 0.13/m<sup>2</sup>, same as last year, and both small and large individuals observed. *Tegula regina* remained relatively abundant at a density of 0.67/m<sup>2</sup>. *Cypraea spadicea* density was 0.21/m<sup>2</sup>. *Crassedoma giganteum* density was 0.033/m<sup>2</sup>. *Megathura crenulata* and *Aplysia californica* were rare with densities of 0.0069/m<sup>2</sup> and 0.12/m<sup>2</sup>, respectively. *Panulirus interruptus* density was 0.0028/m<sup>2</sup>. One fresh 26 mm *Haliotis corrugata* shell was observed.

Fish diversity and abundance were relatively high compared to the other sites at this island, similar to last year. *Coryphopterus nicholsii* were relatively uncommon with a density of 0.04/m<sup>2</sup> and up to 33 individuals observed during the roving diver fish count. *Oxylebius pictus* density was 0.04/m<sup>2</sup> and up to 16 were observed. No *Alloclinus holderi* were observed on 1 m quadrats, but up to 11 were recorded during the fish count. Similar to other Santa Barbara Island sites, *Chromis punctipinnis* were the most abundant species with up to 400 adults observed. Up to seven adult *Oxyjulis californica* were observed. Up to 15 female, six male and five juvenile *Semicossyphus pulcher* were observed. There were no males or juveniles recorded last year at this site. One male *Halichoeres semicinctus* was observed, but no juveniles or females.

*Hypsypops rubicundus* were abundant with up to 43 adults recorded. Two juvenile *H. rubicundus* were observed after sampling. Two adult *Paralabrax clathratus* were observed. Up to nine *Girella nigricans* were observed along the transect. *Rhacochilus vacca* were rare with one adult observed. Two juvenile *Sebastes miniatus* were observed. Up to three adult *Sebastes atrovirens* were observed. Three adult *Sebastes serriceps* were observed. Up to two *Sebastes chrysomelas*, black and yellow rockfish, and one *Sebastes rastrelliger*, grass rockfish, were observed. Two *Gymnothorax mordax*, California moray eel, and two *Scorpaena guttata*, California scorpionfish, were observed. One *Orthopias triacis*, snubnose sculpin, was also observed. Up to 26 *Medialuna californiensis*, halfmoon, and two *Brachystius frenatus*, kelp surfperch, were observed. Roving diver fish counts were performed on May 24<sup>th</sup> with four divers observing 22 species.

This is one of the sites where UCSB/PISCO conducted fish counts in 2007. The PISCO fish sampling protocol was conducted on June 13<sup>th</sup>.

The temperature loggers were retrieved and deployed and all temperature data were downloaded successfully. Both loggers were recording within factory specifications of each other.

## **Discussion**

General trends and observations are described in this section. We would like to emphasize that these are only general trends and observations. A statistical trend analysis for each of the indicator species is required to look at actual trends, but is beyond the scope of this annual report.

All proposed data collection was completed this year except for the annual species lists, which were conducted at only six sites due to limitations on time. The roving diver fish counts and fish transects were performed twice at 12 sites. This was the third and last year of the cooperative agreement between NPS and the UCSB/PISCO divers to conduct their fish transects methodology at 24 of the kelp forest monitoring sites. All PISCO data requests should be made through their webpage at [www.piscoweb.org/data](http://www.piscoweb.org/data).

### **Biological Notes**

In 2007, 13 sites were mature *Macrocystis pyrifera* (giant kelp) forests, two sites were developing kelp forests, one site was in a state of transition, 16 sites were dominated by echinoderms and one site was half mature kelp forest and half dominated by *Strongylocentrotus* spp. Of the 16 sites dominated by echinoderms, three were dominated by *Strongylocentrotus purpuratus*, one by *Ophiothrix spiculata*, one by *O. spiculata* and *S. franciscanus*, one by *O. spiculata* and *S. purpuratus*, two by *S. purpuratus* and *S. franciscanus* and *O. spiculata* and eight were dominated by *S. purpuratus* and *S. franciscanus*. This information is summarized in [Table 4](#) and compares it to the 2006 site status.

At Santa Barbara Island, there was an absence of kelp forests at our six monitoring sites and this is representative of the rest of the island. There seemed to be no continued recovery of the kelp forests that was observed early last year. All six of the sites were mostly dominated by echinoderms. Five of the sites were dominated by *S. purpuratus* and *S. franciscanus*. Southeast Sea Lion and Graveyard Canyon also had an abundance of *Ophiothrix spiculata*. One site, Southeast Reef had a mature kelp forest present along 40 meters of the transect, but the remainder was dominated by *Strongylocentrotus* spp., similar to the other sites. This island remains relatively barren with little algae and similar high echinoderm density and distribution as observed in recent years. There is little indication that kelp forests will return to much of this island in the near future.

At Anacapa Island, the seven KFM sites changed little from last year. Mature kelp forests were present at two sites within the original Anacapa Island Ecological Reserve, one site was in a state of transition presumably towards a kelp forest and the remaining four sites were dominated by echinoderms. Of these four sites, one was dominated by *Ophiothrix spiculata*, two by *O. spiculata*, *S. franciscanus* and *S. purpuratus*, and one site by *Strongylocentrotus purpuratus* and *S. franciscanus*. In general, we feel that these seven kelp forest monitoring sites well reflect the state of rocky reefs surrounding Anacapa Island.

At Santa Cruz Island, the state of the ten sites were all similar to last year. Three had mature kelp forests, while one was in a state of transition to what we presume to become a kelp forest. The remaining seven sites were dominated by echinoderms. Of these, three were dominated by *Strongylocentrotus purpuratus*, and four by *S. purpuratus* and *S. franciscanus*. Though Pelican Bay remained dominated by *S. purpuratus*, there was the development of a kelp forest at the far southern end of the transect. In addition, Fry's Harbor is now what we call in a state of transition and we believe may become a kelp forest soon. We believe the KFM sites well represent the rocky reef conditions on the eastern two thirds of the island, but do not represent the areas west of Gull Island as well.

At Santa Rosa Island, kelp forests continued to be dense and abundant and were present at all seven sites. Mature kelp forests were present at six sites and one, Cluster Point, was a developing kelp forest. Rodes Reef, which was in a state of transition last year, had developed into a mature kelp forest. *Strongylocentrotus* spp. densities remained similar to last year at all Santa Rosa Island sites with notably larger individuals than on the more eastern islands.

At San Miguel Island, kelp forests were also similar to recent years, with healthy and mature plants forming dense canopies at all three of the KFM sites.

Overall, there were few changes in sea urchin abundance at the KFM sites this year. *Strongylocentrotus* spp. densities remained similar to recent years at most sites. *Strongylocentrotus franciscanus* densities decreased at one site and changed little at the remaining 32 sites. *Strongylocentrotus purpuratus* densities decreased at two sites and changed little at the remaining 31 sites. *Strongylocentrotus franciscanus* and *S. purpuratus* recruitment remained low again this year. We observed moderate recruitment of *S. franciscanus* and *S. purpuratus* at two sites. *Lytechinus anamesus* densities remained low at all sites this year and there was little change at the sites where they are typically present. *Centrostephanus coronatus* abundance changed little at all sites, similar to last year.

The presence of sea urchin wasting disease in 2007 (Lafferty and Kushner, 1999, and Richards and Kushner, 1992) was similar to the observations made in recent years. Of the 15 sites where sea urchin wasting disease was observed, six sites were on Santa Cruz Island, four sites were on Anacapa Island and five sites were on Santa Barbara Island ([Table 6](#)). This was similar to our observations in 2006. Diseased *Strongylocentrotus franciscanus* and *S. purpuratus* were observed on all three islands, but diseased *Lytechinus anamesus* were observed only on Santa Cruz Island. Sea urchin wasting disease was not observed on Santa Rosa or San Miguel Islands. At most of the sites where wasting disease was present, prevalence was low ranging from less than 1% to 3%. There were two sites where prevalence was estimated at 5%. Black spot disease was also observed on both *S. franciscanus* and *S. purpuratus* at Cathedral Cove, Anacapa Island.

In 2006, we observed *Patiria minata* with wasting disease that appeared to be triggered by a brief but very warm water event that lasted for about one month (approximately from July 19 – August 21). Though we did observe mortality of *Patiria miniata* in 2006, densities changed little in 2007, so we

presume that mortality was relatively low. The last significant warm water event occurred during the 1997/1998 El Niño and did result in declines in sea star abundances, but this warm water event was significantly longer in duration. The duration and magnitude of warm water events both appear to be important in determining the amount of mortality sea stars incur as a result.

*Pycnopodia helianthoides* abundance remained relatively high at the monitoring sites, but were slightly lower than last year. *Pycnopodia helianthoides* densities increased at one site, decreased at four sites and changed little at the remaining 28 sites. *Pycnopodia helianthoides* continues to appear as an important predator controlling echinoderm populations at the northern Channel Islands.

*Patiria miniata* density changed little this year. We observed increases at two sites, decreases at one site and little or no change at the remaining 30 sites. *Pisaster giganteus* density also changed little with increases observed at one site, decreases at two sites and little changed observed at the remaining 30 sites. *Ophiothrix spiculata* abundance remained about the same as last year. At the six sites where it is relatively abundant, it increased at one and changed little at the remaining five sites. Similar to last year, *Pachythyone rubra* were common at four sites and their abundance at these sites has changed little. Sea star wasting disease was much less common this year and was observed at seven sites compared to 13 in 2006. On Santa Cruz Island, there were four sites where diseased *Patiria miniata* were observed and one site where diseased *Pisaster giganteus* were observed. On Anacapa Island, diseased *A. miniata* were observed at two sites. At the sites where wasting disease was observed, prevalence was low and estimated to range from 1-3%.

Overall, miscellaneous bryozoans and *Diaperoecia californica* cover change little with no noticeable trends this year.

Overall, there was little change in *Panulirus interruptus* densities this year. Densities remain low at most of our sites. A large increase was recorded at one site, decreases were observed at two sites, and the remaining 30 sites had densities that were similar to recent years. However, from our general observations diving inside the newly established marine reserves in and around our regular monitoring sites, we are observing more and larger *P. interruptus* than in past years.

Similar to recent years, *Megastrea undosa* densities remain relatively low and changed little at the islands with all sites having similar abundances as last year. However, we observed some recruitment of this species at Cat Canyon, Arch point, and Pedro Reef. Recruitment has been rare in recent years and we wonder if this recruitment was in part due to the 2006 warm water event. *Lithopoma gibberosa* densities were similar to last year. Overall, *Megathura crenulata* densities also remained similar to last year.

*Haliotis rufescens* were common at six sites, two on San Miguel Island and four on Santa Rosa Island. At two of these six sites densities increased, while at the other four they remained about the same. In general, we are observing a gradual slow increase in abundance of this species at San Miguel and Santa Rosa Islands. We are observing this at the KFM sites, but also at nearby sites

during survey dives. One adult *H. rufescens* was observed with withering foot disease at Miracle Mile. It was collected and sent to CDFG.

Similar to recent years, *Haliotis corrugata* continue to be rare at the islands and were absent on band transects at all sites. Not including what was observed in the ARMs (see below), only three were found at all the sites for size frequencies, two large adults at Landing Cove and one juvenile at Little Scorpion. *Haliotis fulgens* also continue to be rare at the park islands and none were observed this year. Similar to past years, no *Haliotis sorenseni* were observed at the KFM sites or during survey dives. *Haliotis assimilis* were rare again this year with only one observed at Gull Island.

Sponges cover was similar to last year with the high densities recorded at our Santa Rosa Island sites and Miracle Mile on San Miguel. *Tethya aurantia* continue to increase in abundance with density increasing at seven sites, decreasing at one site and remained similar at 25 sites. Overall, tunicate density remained similar to last year. There was little to no change in abundance of *Styela montereyensis* density at all sites.

Most of the comments below and in the site descriptions are based on observations made during the roving diver fish counts. Density observations are based on data collected from 1 m quadrats. On average, *Coryphopterus nicholsii* densities and counts were higher than last year. Similarly but more noticeable was an increase in density and counts of *Lythrypnus dalli* at sites where we would expect to see this species. In 2007 we observed *L. dalli* at 16 sites, compared with 12 sites in 2006. There was little change in average density or counts observed for *Alloclinus holderi* this year. In 2006 we predicted that this warm water species may increase due to the warm water event that was experienced. Though we did not see an overall increase, we did observe *A. holderi* juveniles at three Santa Barbara Island sites. This year was a trial year for sampling *Oxylebius pictus* in 1 m quadrats to determine if this technique would be an effective way to observe changes in abundance of this species over time. After one year of sampling *O. pictus* during 1 m quadrats, we concluded that density levels were too low to detect any measurable changes and we will discontinue counting this species using that protocol.

*Chromis punctipinnis* were observed at 31 sites, similar to recent years, and recruitment of *C. punctipinnis* was less prevalent than last year. As observed in the past, *C. punctipinnis* at Admiral's Reef were observed with lesions probably a result of *Vibiro damsella* bacterial infection (Love et al. 1981). *Semicossyphus pulcher* juveniles were significantly more abundant this year and were observed at 21 sites compared with seven in 2006. Their average counts at the sites also increased to 1.25/site compared to 0.05/site in 2006. Many of the juveniles that were observed in early spring had morphed into small females by the fall. On average, male and female *S. pulcher* abundance was similar to last year. Similarly, male and female *Halichoeres semicinctus* abundances were similar to last year. While juvenile rock wrasse were observed at more sites this year than in 2006, their average abundance per site where they were observed decreased from 5.57/site to 1.61/site. Many *H. semicinctus* were slightly greater than ten centimeters but still maintained the juvenile morphology, so they were included in the female category as per the KFM protocol. Overall *Oxyjulis californica*,

*Hypsypops rubicundus*, and *Paralabrax clathratus* abundance was similar to recent years.. There was one *Paralabrax nebulifer*, barred sand bass, observed at Scorpion Anchorage, these are rarely observed at the islands. We made fewer observations of *Stereolepis gigas*, black sea bass, than last year with none observed during the roving diver fish counts while we made observations at three sites in 2006. However, we made several observations at the sites not during the fish counts. Overall, *Embiotoca* spp. and *Rhacochilus vacca* abundance remained similar to recent years. Adult *Sebastodes atrovirens* abundance was similar to last year, but there was a notable recruitment event with an increase in abundance and prevalence of juveniles. We observed juveniles at 14 sites compared with 10 in 2006 and at the sites where they were observed, their abundance increased to 14.54/site compared to 1.38/site in 2006. A juvenile *Sebastodes pinniger*, canary rockfish, was observed at Gull Island, which is further south than normal for this species. One *Sebastodes rosaceus*, rosy rockfish, was also observed at Gull Island which is a unusual observation for this deeper water species. This season, we observed an abundance of recruitment in juvenile rockfish. Beginning in early spring, many juvenile *Sebastodes mystinus* were observed, while later in the season juvenile *S. paucispinis*, *S. serranoides* and KGB were common to several sites. Many of last year's KGBs appeared to have morphed into subadult *S. atrovirens*. Juvenile *Sebastodes paucispinis*, bocaccio, were more abundant this year with observations at five sites, none were observed in 2006 during the roving dive fish counts. Adult *Sebastodes mystinus* abundance was similar to last year, but juvenile abundance was notably higher. Avarage juvenile density increased and they were observed at 11 sites, compared with six in 2006. Juvenile *Sebastodes miniatus* were also more abundant this year with observations at nine sites compared with two sites last year. *Ophiodon elongatus*, lingcod, were observed at six sites this year versus eleven in 2006. *Scorpaenichthys marmoratus*, cabezon, were observed at thirteen sites, similar to last year. *Scorpaena guttata*, California scorpionfish, were observed at only nine sites this season versus 16 in 2006. There was one *Balistes polylepis*, finscale triggerfish, observed at Pelican Bay which is a highly unusual observation at the islands, but we have made similar observations at this site and it is likely the same fish. One *Hexagrammos decagrammus*, kelp greenling, was observed at Chickasaw. This species has been observed only twice before at the islands during the fish count.

### **Unusual Species / Non-Indicator Species**

We continue to observe *Bursa californica* at many of our sites and these have become notably more common since about 2000. This species used to be rare at the Channel Islands, now it is common at many of them.

We observed one large live *Pteria Sterna*, pearl oyster, growing on a gorgonian at Lighthouse, Anacapa Island. The last large recruitment event we observed for this species was during the 1997/1998 El Niño and it is possible that this oyster is from that event. Since that El Niño, sitings live *P. sterna* have become more and more rare.

### **Artificial Recruitment Modules (ARMs)**

ARMs were present and monitored at 11 sites in 2007, including the ARMs installed at Miracle Mile. The below observations refer to all 11 kelp forest monitoring sites with ARMs.

*Haliotis* spp. continue to be in low abundance in the ARMs. For the purpose of this report, we consider juvenile abalone less than 51 mm and adults > 50 mm. Juvenile *Haliotis rufescens* were noticeably less abundant in the ARMs with only one observed compared to nine in 2006. Adults were similar in abundance with nine observed, same as last year. Similar to last year, all but one of the *H. rufescens* found in the ARMs were from Miracle Mile and the other one was from Johnson's Lee South. *Haliotis corrugata* recruitment remained low, but was notably higher than last year with seven juveniles found compared with two in 2006. We observed *H. corrugata* in the ARMs at five sites compared with only two in 2006. No *H. fulgens*, *H. sorenseni* or *H. assimilis* were observed in the ARMs this season, similar to recent years.

Fewer *Kelletia kelletii* were observed this year with only 12 found. Nine of these were less than 51 mm compared with 18 found in this size range last year. In 2006 most of the small *K. kelletia* were observed in the ARMs at Landing cover, while this year they were rare there and most were observed at Cathedral Cove. *Cypraea spadicea* abundance remained similar to last year, and we observed ones with juvenile morphology at many sites.. *Crassedoma giganteum* density changed little with most sites on average being similar to last year.

Both *Patiria miniata* and *Pisaster giganteus* abundance and sizes in the ARMs were similar to last year. *Patiria miniata* density in the ARMs decreased at two sites and remained similar to last year at nine sites. *Pisaster giganteus* increased at one site and remained similar at the remaining 10 sites. There was little change observed in *Pycnopodia helianthoides* density in the ARMs this year. *Strongylocentrotus franciscanus* density increased at one site, decreased at two and little or no change was observed at the remaining eight sites. Similarly, densities of *Strongylocentrotus purpuratus* in the ARMs increased at three sites, decreased at one site and remained similar to last year at the remaining seven sites. *Centrostephanus coronatus* density remained low with five observed in the ARMs this year, three were under 10 mm, indicating some recent recruitment. *Parastichopus parvimensis* densities were similar to last year at nine sites and decreased at two sites. Densities were anomalously high at these two sites in 2007.

### New/Other Projects

There were no new projects to report on this year. 2007 marks the first year of a two-year agreement to conduct benthic CRANE surveys at select sites at the Channel Islands. This project was supported by CDFG and funded by the California Coastal Conservancy. This project is jointly conducted with UCSB/PISCO. In 2007, the KFM staff conducted benthic CRANE surveys at 11 sites. A summary of these sites sampled can be found in Table 8. The data from these surveys was provided to CDFG and they are responsible for the reporting and archiving of this information.

### Temperature

In 2007 two Tidbit loggers were deployed at all sites. In previous years, a combination of StowAway™ and Tidbit temperature loggers were deployed, and the data were cross-referenced. We

experienced several failures with the StowAway loggers, while the Tidbit™ loggers have proven to be more reliable and we have since converted solely to their usage.

Temperature data were successfully downloaded from all sites in 2007, however, there was one failed logger recovered from the south end unit at Johnson's Lee South which did prevent us from making comparisons between loggers at this site. At Websters Arch, the two loggers were recording more difference between the two than we typically observe, the average difference between these was 0.24 °C.

### **Protocol Changes**

Beginning in 2005, additional fish sampling methods were conducted at all sites through a cooperative agreement with the UCSB/PISCO subtidal survey program. This cooperative agreement is for three years of conducting this protocol at the 24 KFM sites that are associated with our fine scale study of marine reserves. PISCO monitored all 24 sites this year and this is the last year of this cooperative agreement. For all PISCO data requests, visit their website at [www.piscoweb.org/data](http://www.piscoweb.org/data).

In 2007, we began incorporating permanent observer numbers to our monitoring program and incorporated them into the Access database. A permanent observer number is a unique number associated with each diver who collects data during a sampling event. This number will be utilized during data entry for some of the sampling techniques (e.g. roving diver fish counts and natural habitat size frequencies). The permanent observer numbers are obtained from the Access database table KF\_PermanentObserver Numbers and protocol on how to assign new numbers will included in our revised edition of the KFM Handbook Volume 1 (sitation). By having permanent numbers this will facilitate looking at observer variability which could be important in analysis, especially for fish observations.

There were two new “species” added to the 1 m quadrat protocol this year. *Macrocystis pyrifera* stipes and *Oxylebius pictus* were added. The *Macrocystis pyrifera* stipe counts were added to acquire density of stipe as most other monitoring programs measure this metric. *Oxylebius pictus* was added as a trial species to see if we thought that this was a viable species to count on 1 m quadrats. We decided that densities are unlikely to be high enough to acquire significant densities and will discontinue this species after this year. The data collected from these two additions are included in this report and are available in Appendices A and N.

A new fish size frequency method was added to the KFM protocol in 2007. This new protocol is called the roving diver fish size frequency protocol. The fish sizing technique was implemented to incorporate fish size characteristics into the KFM database. A description of the sampling protocol can be found in Appendix O and the training procedure in Appendix P.

### **Changes to the Database**

In 1985, at Anacapa Island Admiral's Reef it appears that the density for *Muricea fruticosa* may be both *M. fruticosa* and *M. californica* combined. There is typically more *M. californica* than *M.*

*fruticosa* at this site. Also at the above site, one *Stylaster (Allopora) californica* was removed from the database as we are nearly 100% confident that this was an error on the datasheet because it is unlikely this species was observed at this site.

The year 2007 marks the first year we successfully completed the KFM fish size frequency protocol at all of our monitoring sites. All data collected by observers was entered into a new Access form labeled Fish Size Frequency. These results are not included in this report, but raw data is available by request.

The year 2007 also marks the first year we successfully added *Macrocystis pyrifera* stipe counts to our 1 m quadrat protocol. Stipe counts have been added to the 1 m quadrat form as species #2002.99 in the Access database.

This year was a trial year for sampling *Oxylebius pictus* in 1 m quadrats to determine if this technique would be an effective way to observe changes in abundance of this species over time. After one year of sampling *O. pictus* during 1 m quadrats, we concluded that density levels were too low to detect any measureable changes and we will discontinue counting this species using that protocol. Therefore this species, which was #14030 in the database, will be removed from the 1 m quadrat Access form. The data collected this year are available in Appendix N.

## **Data Requests**

In 2007, the KFMP received nine data requests and all were fulfilled as follows:

1. *Kelletia kelletii* density and size frequency data was sent to Dr. Crow White at the University of California Santa Barbara. The data will be used to assist Dr. White's research on individual dispersal and patterns of population connectivity in *K. kelletia*.
2. Temperature data for San Miguel Island was sent to Laura Rodgers Bennett at California Department of Fish and Game. This data is being used in association with research on *Haliotis rufescens* and withering foot syndrome.
3. Kelp Forest Monitoring density data was sent to John Lynham at the University of California at Santa Barbara. The data is being used to help assess the effects of marine protected areas (MPAs).
4. Temperature data from the original 16 Kelp Forest Monitoring sites was sent to Ralph Larson.
5. The KFM data was discussed during a 2007 PISCO/NCEAS workshop.
6. *Parastichopus* spp. density data was sent to David Ono at the California Department of Fish and Game. This data will assist with updating the fishery report from the year 2000 to present.
7. *Haliotis rufescens* density data was sent to Marco Hatch at the University of California San Diego.

8. All Kelp Forest Monitoring data was sent to Ed Parnell at Scripps Research Institute of Oceanography. Dr. Parnell will be using the data to do long-term trend analysis.
9. All 2007 CRANE data was sent to Jen Casselle at UCSB's PISCO monitoring group. Our data will be combined with data collected by PISCO's divers and the dataset will be sent to CDFG to assist with resource management.

### **Presentations**

Jarrett Byrnes presented “Combining Long Term Surveys with Structural Equation Modeling to Examine Kelp Forest Food Webs” at North American Benthological Society 55 Annual Meeting.

### **Publications**

## **Appendix G. Fish Size Frequency Distributions.**

No fish size frequency distributions are included in this annual report. Raw fish size frequency data is available upon request from the Channel Islands National Park.

## Appendix H. Natural Habitat Size Frequency Distributions.

### 2007 NATURAL HABITAT SIZE FREQUENCY DISTRIBUTIONS

## **Appendix M. Temperature Data.**

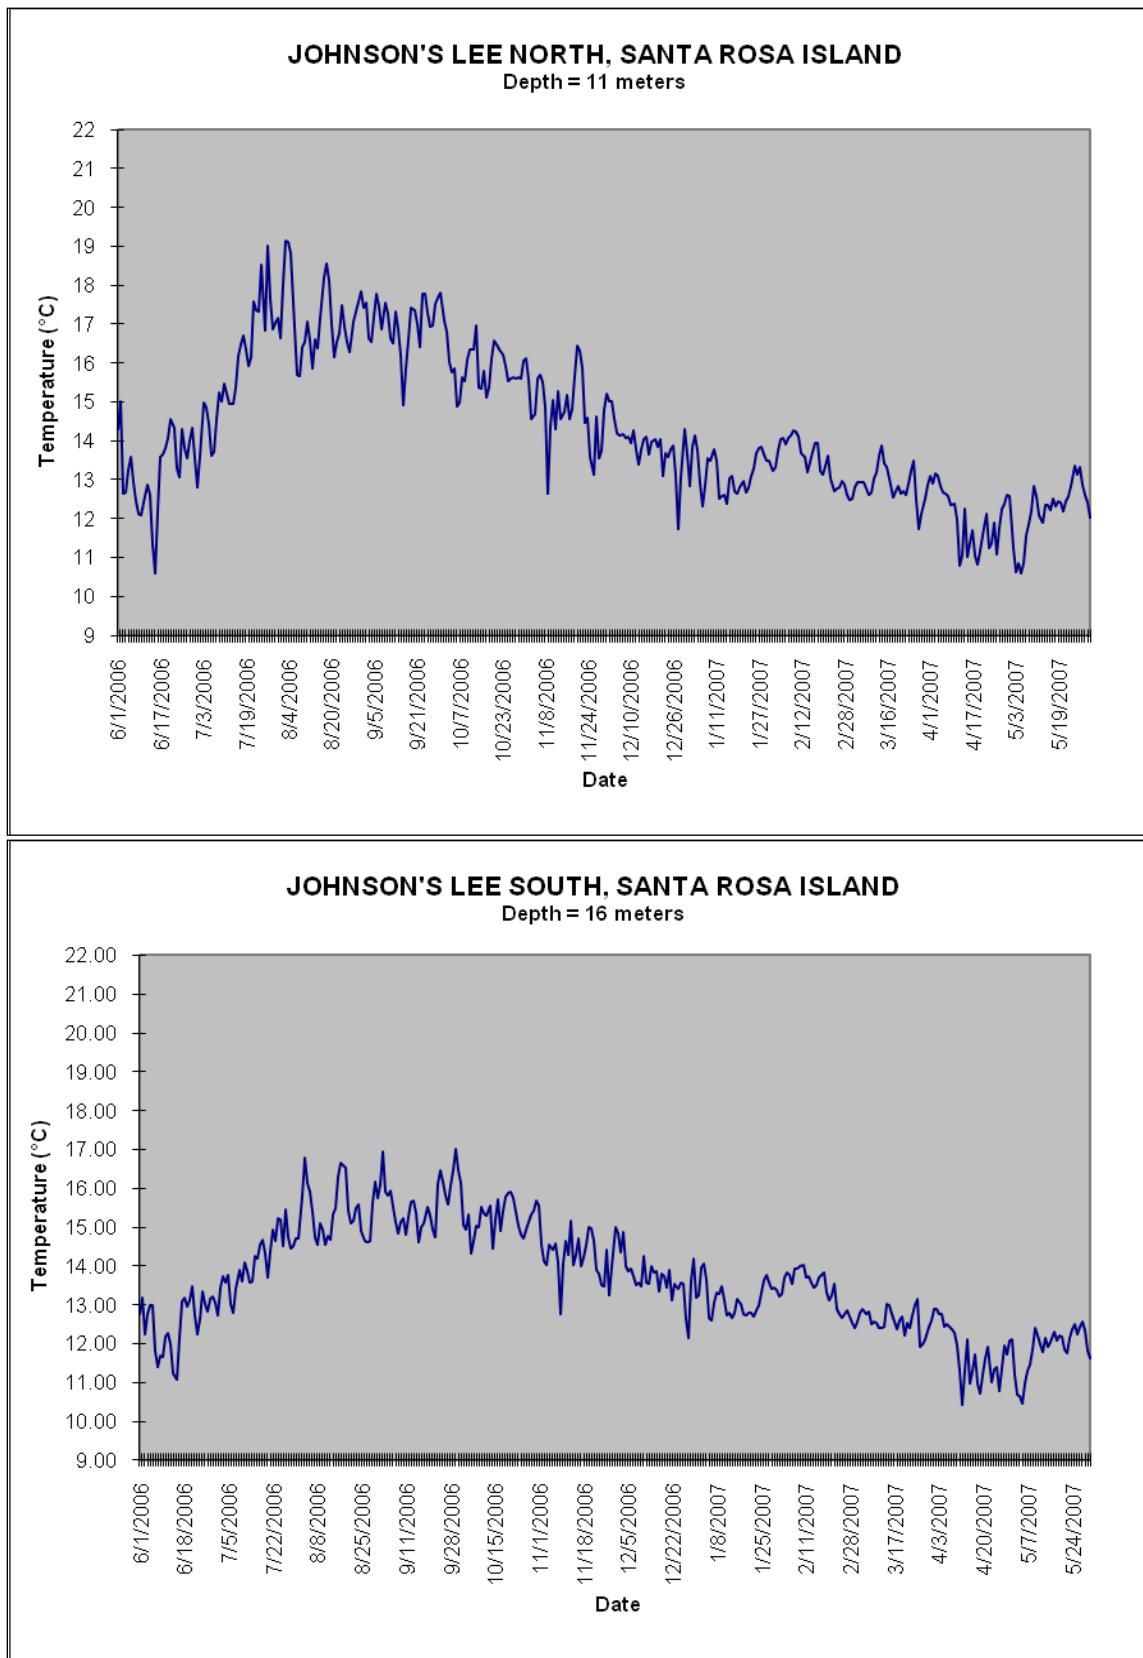

### **Introduction**

This appendix contains the temperature data (presented graphically) collected by temperature loggers that were deployed at 32 Kelp Forest Monitoring sites. Missing data at some sites is the result of technical problems or loss of the temperature unit. Temperature loggers were not deployed until the first date of sampling at the 16 new sites this year as noted in the graphs.

## **Appendix O. Fish Size Frequency Method.**

### **Purpose**

To estimate fish population size structure

### **Materials**

- 1 fish slate with 40 cm etched marks along top edge (Figure 3)
- 1 fish size frequency summary sheet (Figure 4)

### **Personnel**

A minimum of one SCUBA equipped observer who has been trained in underwater fish size frequencies. If only one trained observer is available, this observer's buddy can conduct roving diver fish counts, as both divers will be covering the same area within the same time frame.

### **Methods**

This method will be performed during or after the roving diver fish count (RDFC) in accordance with the RDFC protocol with a minimum sampling time of 30 minutes. As with the RDFC, the observer will sample as much of the 2000 m<sup>2</sup> area (ten meters on either side of the 100 m permanent transect line) as possible. Within this area and time, as many fish sizes of the species prioritized below will be measured. The observers for this protocol must be trained, tested and be able to accurately estimate fish sizes underwater. Training procedures for this protocol can be found in Appendix P. The observer should be proficient in sizing fish to within 20% of the actual total length (TL).

Observers will estimate TL (Figure 2) of small fish (<15 cm TL) to the nearest centimeter and larger fish (>15 cm) to the nearest 5 cm. All observed species names and sizes are recorded on a blank dive slate. In the case where there are relatively high densities of certain species (e.g. *Chromis punctipinnis*, blacksmith), a size range measurement for the entire school is recorded in parentheses followed by a count (Figure 3). If gender is visually distinguishable (e.g. California sheephead and rock wrasse) these are kept separate and recorded as well. Similar to the RDFC method, each observer should attempt to search all habitats (i.e. bottom, midwater, under ledges, water column, canopy, etc.); however, cryptic species are not measured (see organisms sampled section below).

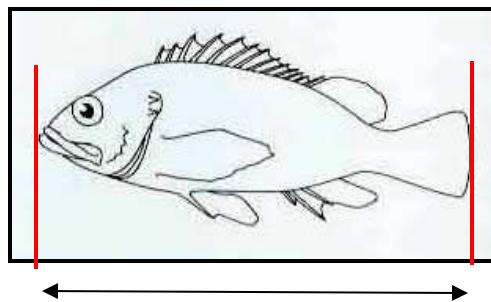

Figure 2. Total length, TL, of a fish.

Upon completion of the dive, each observer will review and tally all totals for each size category per species. On the surface and as soon as possible with the assistance of a recorder, the observer transfers the information from the dive slate to a fish size frequency summary datasheet (Figure 4). Repeat this procedure for each observer on the same datasheet. The summary datasheets are then stored and from these sheets the data are entered into the database after the cruise.

	5	10	15	20	25	30	35	40	45		
Blacksmith	(4-5) 13	6 5, 20 25	(8-10) 55, 12 67	(12-14) 46	Senorita	(10-12) 35	(16) 5, 2 7	(20-22) 1	16 1	Kelp Bass	
										Sheephead	
										Male 40 1	
										Juvenile (8-10) 3	
										Rock Wrasse Female 10 1 (14-16) 2 Cabezon 20 1 Blue Rockfish (10-12) 5, 7, 2 14	

The count for each size class is circled.

Size ranges are written in parenthesis.

Figure 3. An example dive slate for fish size frequency measurements.

Common Name								
Black & yellow rockfish	Count							
	Length (cm)							
Black surfperch	Count							
	Length (cm)							
Blacksmith	Count	13	25	67	46			
	Length (cm)							
Blue rockfish	Count	4-5	6	8-10	12-14			
	Length (cm)							
Cabezon	Count	14						
	Length (cm)	10-12						
California scorpionfish	Count							
	Length (cm)	1						
California sheephead	Count							
	fem	20						
	juv							
	male							
	Length (cm)							

Notice the separate rows for gender and juveniles.

Figure 4. An example of summarized data on a fish size frequency summary sheet.

A minimum of 30 minutes is required to cover a site and collect adequate sample size of indicator species present. More time can be used if necessary to get a larger sample size, similar to size frequency measurements of invertebrates and *Macrocystis pyrifera*.

#### Time Required

A minimum of 30 minutes per observer is required to measure fish.

#### Organisms Sampled

No cryptic species should be measured for size (e.g. *Alloclinus holderi*, *Coryphopterus nicholsii*, *Lythrypnus dalli* and *L. zebra*, *Gibbonsia* spp., *Citharichthys* spp., *Cottidae*, *Leiocottus hirundo*, etc.). Schooling baitfish such as sardines, anchovies and smelt will also not be sized. All other species can be measured.

## **Appendix P. Fish Size Frequency Training Protocol.**

### **Purpose**

To learn the skills to accurately size fish underwater

### **Materials**

A minimum of six fish size frequency training model arrays (Figure 5)

One dive slate per trainee with a 40 cm scale (minimum) along top edge marked in 5 cm increments (Figure 3)

One fish size frequency training datasheet per trainee (Figure 6)

One training model array fish size answer sheet per trainee (Figure 7)

### **Personnel**

Trainees already proficient in identifying fish species as required by the Roving Diver Fish Count protocol

### **Fish size frequency training exercise**

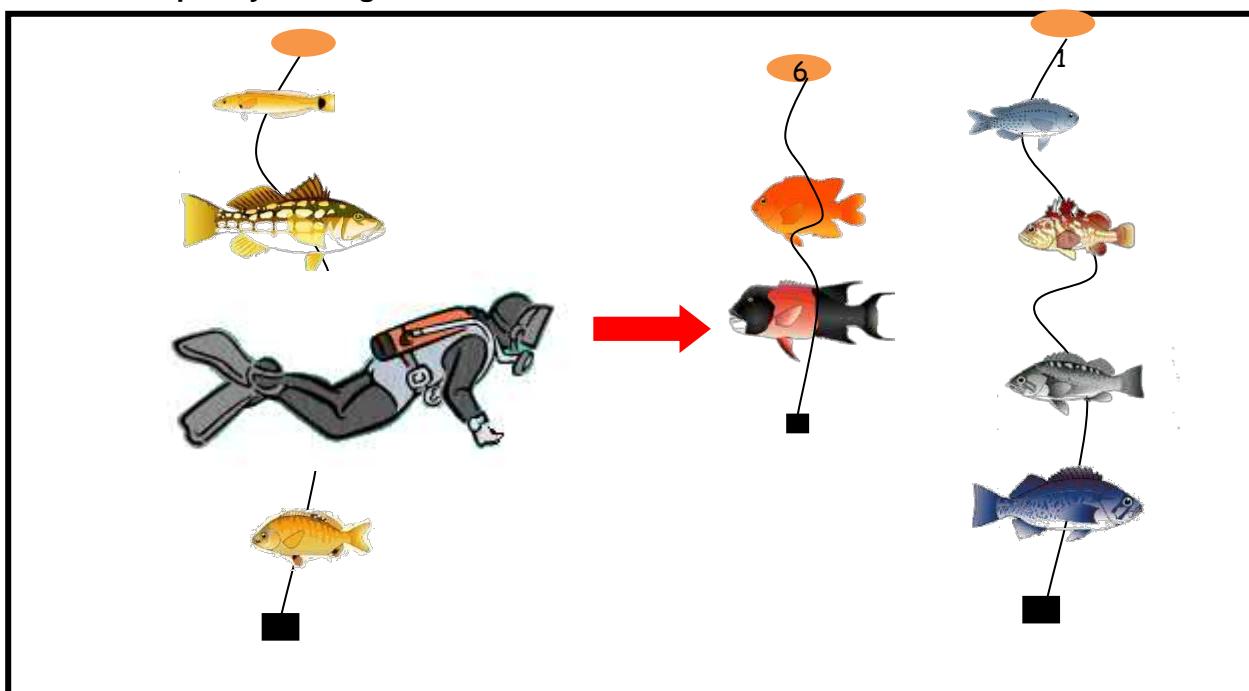

Figure 5. Fish size frequency training model arrays.

One or more pair of divers will assist in setting up the fish size frequency training model arrays in a course-like fashion underwater prior to the trainees beginning their dive. Each fish size frequency training model array is made up of plastic models of various fish sizes and species that are attached in series to a line anchored to the seafloor by a weight (Figure 5). Trainees should already be proficient in fish identification and should only concern themselves with fish sizes during this

exercise. Each trainee will be equipped with a fish size frequency datasheet with a series of vertical lines representing each fish model array (Figure D). Alternatively this can be drawn on a blank data slate. Along the vertical lines are blank spaces on which to record fish measurements for each individual array. Not all model arrays have the same number of fish on them, so some spaces may be left blank. Working in buddy pairs, descend and locate where the fish size models were placed. The trainees will swim through the array course and record the total length of each fish to the nearest centimeter. The fish sizes need to be recorded in the same order as the fish on the arrays to facilitate checking later. Also, each training array has an identifying number located on the float that should be recorded on the datasheet at the top of each vertical line. This will assist with the grading of size measurements once the student returns to the surface.

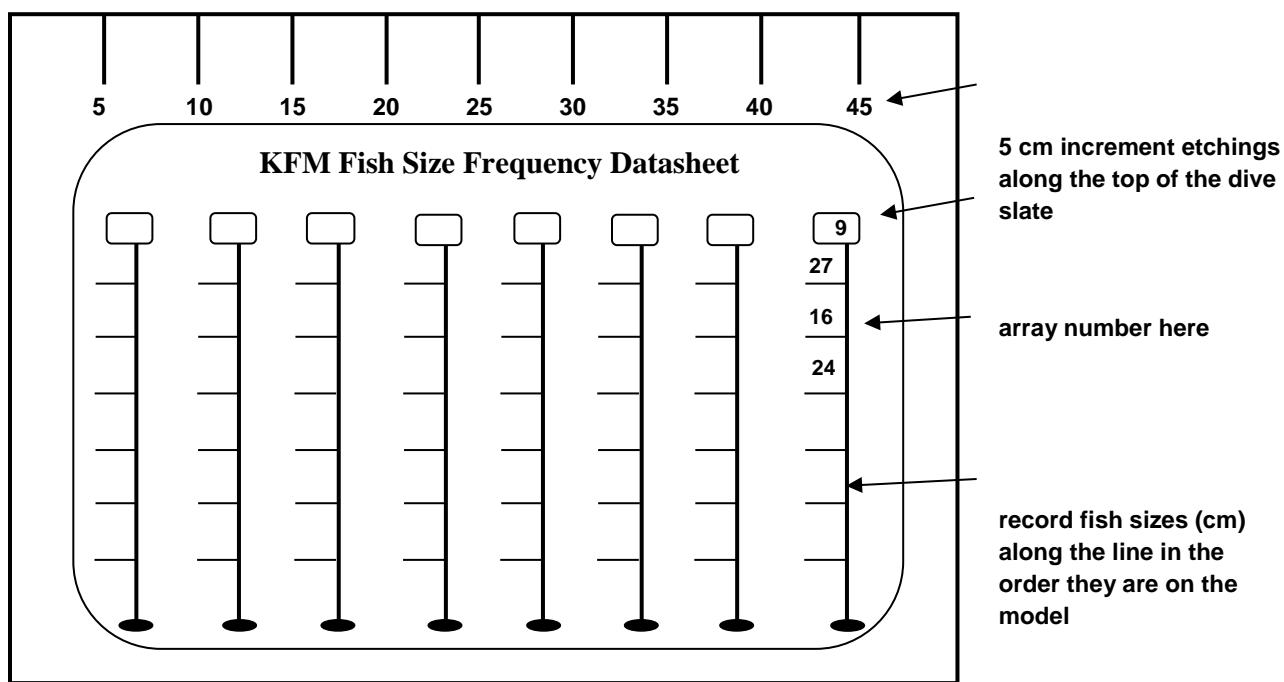

Figure 6. Fish size frequency slate with a fish size frequency training datasheet.

Students should make an effort to maintain a consistent pace through the course. Stopping at every fish is not possible with live fish, so sizes should be recorded as quickly and as accurately as possible. After the course has been completed the student should compare their size measurements with the laminated answer sheets (Figure C). At this point, trainees should take particular note if there are specific characteristics of fish that result in consistent over- or underestimation of size (elongate fish, bright body colors, etc). Each trainee will continue swimming through and measuring all the model arrays until they feel confident that all measurements are accurate within one or two centimeters of the correct length for each fish. Students will likely have to make several passes through the arrays before consistent measurements are achieved. After several passes, trainees may begin to remember the size of the fish models, so no more than six passes should be conducted during any one training session.

After a diver has gone through this training and can measure fish with 20% or less error, the diver is now ready to size live fish with a trained observer. The trained observer and trainee will then measure the same fish and sizes will be compared during or at the end of the dive. Fish size frequency training is complete when the trained observer compares measurements with the student and feels confident that they are measuring with high consistency and accuracy. Accuracy within 20% or less of the actual size is sufficient.

### Sizing Aids

There are a variety of different sizing aids that observers can use. Each fish slate has etchings along the top edge in 5 cm increments that should be used as the primary sizing aid. Divers can measure the width of their hand and use that for reference as well. If one is able to get a comparison measurement using natural habitat features such as a rock, kelp blade or plant that a fish was observed near, that too can be very useful. Observers should use whatever aids they can to get the best size estimate possible. Be resourceful and practice using these aids during the fish size frequency training exercise.

Aside from everything appearing larger underwater, there are many other factors that can influence the sizing of fish underwater and each observer should take great care during their training to discern whether they tend to over- or underestimate in each situation. Students should always be aware of these tendencies during fish size frequency sampling. Listed below are some factors that tend to influence the over- and/or underestimation of fish sizes.

<u>Overestimation</u>	<u>Underestimation</u>
low light conditions	bright light conditions
dull body color	bright body color
poor visibility	good visibility
object in foreground	objects in background
deep-bodied fish	elongate fish

<u>Fish Size Frequency Training Answer Sheet</u>										
<b>Array #</b>	1	2	3	4	5	6	7	8	9	
<b>Length</b>	top	14.5	31.0	25.0	13.0	25.0	18.0	19.5	18.0	29.0
(cm)		42.0	16.0	23.5	27.0	18.0	13.5	50.0	28.0	15.0
		26.5	25.0	22.0	12.0	-----	13.5	27.0	13.0	24.0
		bottom	44.0	25.0	26.0	23.0	-----	27.5	-----	22.0

Figure 7. Fish size frequency training answer sheet.

Additional fish sizing information is available on the PISCO website at [www.piscoweb.org](http://www.piscoweb.org).
